YASKAWA

YRC1000 GENERAL OPERATOR'S MANUAL

Upon receipt of the product and prior to initial operation, read these instructions thoroughly, and retain for future reference.

MOTOMAN INSTRUCTIONS

MOTOMAN-DDD INSTRUCTIONS YRC1000 INSTRUCTIONS YRC1000 OPERATOR'S MANUAL (GENERAL) (SUBJECT SPECIFIC) YRC1000 MAINTENANCE MANUAL YRC1000 ALARM CODES (MAJOR ALARMS) (MINOR ALARMS)

Have the following information available when contacting the YASKAWA Representative:

- System
- Primary Application
- Software Version (Located on Programming Pendant by selecting: {Main Menu} - {System Info} - {Version})
- Warranty ID (Located on Robot Controller)
- Robot Serial Number (Located on Manipulator data plate)
- Robot Sales Order Number (Located on Robot controller data plate)

Use for urgent or emergency needs for technical support, service and/or replacement parts

Routine Technical Inquiries: techsupport@motoman.com

Allow up to 36 hours for response

24-hour Telephone Number: (937) 847-3200

Part Number: 178645-1CD Revision: 15 MANUAL NO. RE-CSO-A051 🚸

- This manual describes the various components of the YRC1000 system and general operations. Read this manual carefully and be sure to understand its contents before handling the YRC1000. Any matter, including operation, usage, measures, and an item to use, not described in this manual must be regarded as "prohibited" or "improper".
- General information related to safety are described in "Chapter 1. Safety" of the YRC1000 INSTRUCTIONS. To ensure correct and safe operation, carefully read "Chapter 1. Safety" of the YRC1000 INSTRUCTIONS.

- In some drawings in this manual, protective covers or shields are removed to show details. Make sure that all the covers or shields are installed in place before operating this product.
- YASKAWA is not responsible for incidents arising from unauthorized modification of its products. Unauthorized modification voids the product warranty.

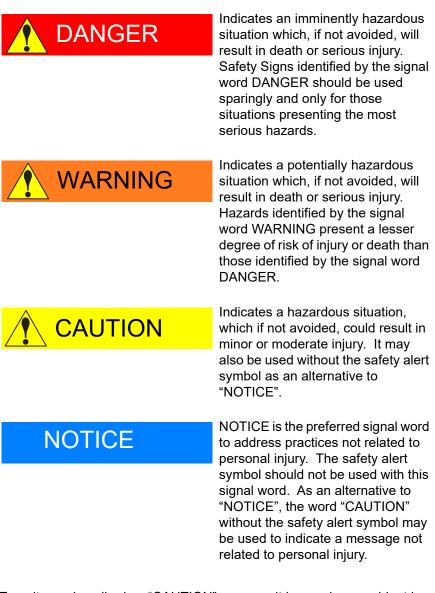

NOTICE

- The drawings and photos in this manual are representative examples and differences may exist between them and the delivered product.
- YASKAWA may modify this model without notice when necessary due to product improvements, modifications, or changes in specifications. If such modification is made, the manual number will also be revised.
- If your copy of the manual is damaged or lost, contact a YASKAWA representative to order a new copy. Be sure to tell the representative the manual number listed on the front cover.

Notes for Safe Operation

Read this manual carefully before installation, operation, maintenance, or inspection of your product.

In this manual, the Notes for Safe Operation are classified as "DANGER", "WARNING", "CAUTION", or "NOTICE".

Even items described as "CAUTION" may result in a serious accident in some situations.

At any rate, be sure to follow these important items.

To ensure safe and efficient operation at all times, be sure to follow all instructions, even if not designated as "DAN-GER", "WARNING" and "CAUTION".

- Before operating the manipulator, make sure the servo power is turned OFF by performing the following operations. When the servo power is turned OFF, the SERVO ON LED on the programming pendant is turned OFF.
 - Press the emergency stop buttons on the front door of the YRC1000, on the programming pendant, on the external control device, etc.
 - Disconnect the safety plug of the safety fence.
 (when in the play mode or in the remote mode)

If operation of the manipulator cannot be stopped in an emergency, personal injury and/or equipment damage may result.

Fig. : Emergency Stop Button

• Before releasing the emergency stop, make sure to remove the obstacle or error caused the emergency stop, if any, and then turn the servo power ON.

Failure to observe this instruction may cause unintended movement of the manipulator, which may result in personal injury.

Fig. : Release of Emergency Stop

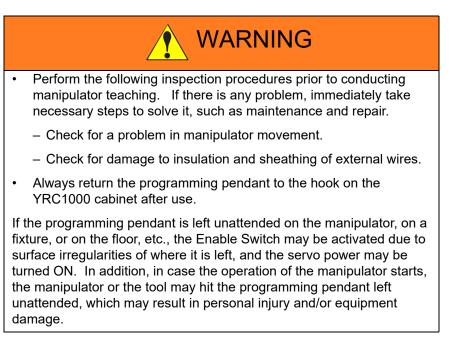

- Observe the following precautions when performing a teaching operation within the manipulator's operating range:
 - Be sure to perform lockout by putting a lockout device on the safety fence when going into the area enclosed by the safety fence. In addition, the operator of the teaching operation must display the sign that the operation is being performed so that no other person closes the safety fence.
 - View the manipulator from the front whenever possible.
 - Always follow the predetermined operating procedure.
 - Always keep in mind emergency response measures against the manipulator's unexpected movement toward a person.
 - Ensure a safe place to retreat in case of emergency.

Failure to observe this instruction may cause improper or unintended movement of the manipulator, which may result in personal injury.

- Confirm that no person is present in the manipulator's operating range and that the operator is in a safe location before:
 - Turning ON the YRC1000 power
 - Moving the manipulator by using the programming pendant
 - Running the system in the check mode
 - Performing automatic operations

Personal injury may result if a person enters the manipulator's operating range during operation. Immediately press an emergency stop button whenever there is a problem. The emergency stop buttons are located on the front panel of the YRC1000 and on the upper right of the programming pendant.

 Read and understand the Explanation of the Warning Labels before operating the manipulator.

Definition of Terms Used Often in This Manual

The MOTOMAN is the YASKAWA industrial robot product.

The MOTOMAN usually consists of the manipulator, the controller, the programming pendant, and manipulator cables.

In this manual, the equipment is designated as follows.

Equipment	Manual Designation
YRC1000 controller	YRC1000
YRC1000 programming pendant	Programming pendant
Cable between the manipulator and the controller	Manipulator cable

Equipment		Manual Designation
Programming Pendant	Character Keys /Symbol Keys	The keys which have characters or symbols printed on them are denoted with []. e.g. [ENTER]
	Axis Keys /Numeric Keys	[Axis Key] and [Numeric Key] are generic names for the keys for axis operation and number input.
	Keys pressed simultaneously	When two keys are to be pressed simultaneously, the keys are shown with a "+" sign between them, e.g. [SHIFT]+[COORD].
	Mode Switch	Mode Switch can select three kinds of modes that are denoted as follows: REMOTE, PLAY or TEACH. (The switch names are denoted as symbols)
	Button	The three buttons on the upper side of the programming pendant are denoted as follows: START, HOLD, or EMERGENCY STOP. (The button names are denoted as symbols)
	Displays	The menu displayed in the programming pendant is denoted with { }. e.g. {JOB}

Descriptions of the programming pendant keys, buttons, and displays are shown as follows:

Description of the Operation Procedure

In the explanation of the operation procedure, the expression "Select • • • " means that the cursor is moved to the object item and [SELECT] is pressed, or that the item is directly selected by touching the screen.

Registered Trademark

In this manual, names of companies, corporations, or products are trademarks, registered trademarks, or brand names for each company or corporation. The indications of (R) and TM are omitted.

- 1 Introduction
- 1.1 YRC1000 Overview

1 Introduction

1.1 YRC1000 Overview

The main power switch and the door lock are located in the upper left on the front panel of the YRC1000.

The emergency stop button is installed in the upper right on the front panel of the YRC1000, and the programming pendant can be hung from a hook below the button.

For information on setup, installation, and connection of the YRC1000 system, refer to the "YRC1000 INSTRUCTIONS (RE-CTO-A221)".

Fig. 1-1: YRC1000 Front View

- 1 Introduction
- 1.2 Programming Pendant

1.2 Programming Pendant

1.2.1 Programming Pendant Overview

The programming pendant is equipped with the keys and buttons used to perform manipulator teaching, job editing and playback, etc.

- 1 Introduction
- 1.2 Programming Pendant

1.2.2 Key Description

1.2.2.1 Character Keys and Symbol Keys

The keys with characters or symbols printed on them are denoted with [].

For example, ever is denoted as [ENTER].

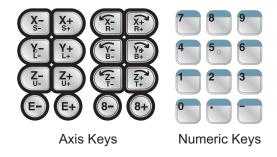

To each numeric key, functions other than numerical entry are allocated.

In the description of our instruction manuals, only the function explained there is denoted as the key.

For example, **I** is denoted as [1] when the key is used to enter the numerical value 1, and denoted as [TIMER] when used to register the timer instruction.

1.2.2.2 Axis Keys and Numeric Keys

The keys shown below are collectively referred to as [Axis Keys] and [Numeric Keys].

1.2.2.3 Keys Pressed Simultaneously

When two keys must be pressed simultaneously, the keys are shown with a "+" sign between them, such as [SHIFT] + [COORD].

- 1
- Introduction Programming Pendant 1.2

1.2.3 Programming Pendant Keys

	Storte the manipulator motion in playback
[START]	Starts the manipulator motion in playback operation.
	The lamp on this button lights up during the play oper- ation.
	 The lamp also lights up when the playback operation is started by the START signal of system input. The lamp turns OFF when the playback operation is stopped by alarm occurrence, HOLD signal, or mode change.
[HOLD]	Temporarily stops the manipulator motion.
	 This button is enabled in any mode. The lamp on this button lights up only while the button is being pressed. Although the lamp turns OFF when the button is released, the manipulator stays stopped until a next START command is input. The HOLD lamp automatically lights up in the follow- ing cases to indicate that the system is in HOLD sta- tus. The start and axis operations are disabled while the lamp lights up. The HOLD request is being sent from an external device in remote mode. In the HOLD status caused by an error occurred in working process such as wire sticking at arc welding. While communication between the YRC1000 and the programming pendant is disconnected, the manipula- tor does not stop its operation even if [HOLD] is
	pressed.
[EMERGENCY STOP]	 Turns OFF the servo power. When the servo power is turned OFF, the "SERVO ON" LED on the programming pendant turns OFF. An emergency stop message is shown on the display.
Mode Switch	Selects the Play mode, Teach mode, or Remote mode.
	PLAY: Play Mode The playback of a taught job can be performed. The START signal from an external device is disabled.
	TEACH: Teach Mode Axis can be operated and operation can be edited by using the programming pendant. The START signal from an external device is disabled.
	REMOTE: Remote Mode Operation by an external signal is enabled. During the remote mode, [START] of the programming pendant is disabled.
	• While communication between the YRC1000 and the programming pendant is disconnected, the mode of the YRC1000 cannot be changed.

1 1.2 Introduction Programming Pendant

Enable Switch	Turns ON the servo power.When the Enable Switch is lightly squeezed while the
	"SERVO ON" LED is blinking and the Mode Switch is
S-20-	set to TEACH, the power turns ON.
	• When this switch is released or firmly squeezed while the power is turned ON, the power turns OFF.
[SELECT]	Works as described below. Selects a menu item in the main menu area and the
	menu area.
	• Makes the selected item ready to be set in the gen-
	eral-purpose display area.Shows two or more messages in the human interface
	display area.
Cursor Key	Moves the cursor in the direction of the arrow
[↑] UP	• The size of the cursor and the range/place where the cursor can move vary depending on the window.
	• In the JOB CONTENT window, if the UP cursor is
	,
	moves to the last line of the job. Conversely, if the cursor is on the last line of the job and the DOWN cu
	sor is pressed, the cursor will jump to the first line of
	the job.
	[SHIFT] + [↑] (UP)
	Scrolls the screen upward. [SHIFT] + [↓] (DOWN)
	Scrolls the screen downward.
	$[SHIFT] + [\rightarrow] (RIGHT)$ Scrolls the screen to the right.
	[SHIFT] + [←] (LEFT)
	Scrolls the screen to the left.
[MAIN MENU]	 Displays the main menu. When the main menu is shown, press this key to hide
	the main menu.
	[MAIN MENU] + UP
	Increases the brightness of the screen.
	[MAIN MENU] + DOWN Decreases the brightness of the screen.
[SIMPLE MENU]	Displays the simple menu.
	• When the simple menu is shown, press this key to hide the simple menu.
	[SHIFT] + [SIMPLE MENU]
	Registers the layout displayed in the general-purpose area to the user defined menu.
	Press [SIMPLE MENU] for three seconds to display the pop-up menu window.

	Fuching the course names are to be to be
[SERVO ON READY]	Enables the servo power supply to be turned ON.
SERVO ON READY	 If the servo power supply is shut OFF by the emergency stop or overrun signal, press this key to enable the servo power supply to be turned ON. When this key is pressed, in the play mode, the servo power supply turns ON if the safeguarding is securely closed; in the teach mode, the "SERVO ON" LED blinks, and the servo power supply turns ON with the Enable Switch turned ON;
	 while the servo power is ON, the "SERVO ON" LED lights up.
	Cancels the current status. Hides the sub menu in the main menu area and the
CANCEL	 menu area. Cancels the current input data or input status in the general-purpose display area. Cancels the list of messages in the human interface display area. Cancels the current error.
	[SHIFT] + [CANCEL] When the job content is shown and the undo function is enabled, the assist menu is shown.
[MULTI]	Works for the multi mode.
	 If this button is pressed when the multi mode is ON, the active window switches.
	[SHIFT] + [MULTI] Switches between the multi-window display and the single-window display when the multi mode is ON.
[COORD]	 Selects the operation coordinate system when the manipulator is operated manually. The coordinate system can be selected from the six coordinate systems, i.e., joint, Cartesian, cylindrical, tool, user, and teaching line. Each time this key is pressed, the coordinate system is switched in the following order: JOINT → CAR/CYL → TOOL → USER → TEACHING LINE (only for arc welding purpose) The selected coordinate system is shown in the status display area.
	[SHIFT] + [COORD] The number of the coordinate system can be changed when the "TOOL" or "USER" coordinate system is selected.

[DIRECT OPEN]	Displays the content related to the current line.
DIRECT OPEN	 When the job content is displayed, move the cursor to an instruction and press this key to show its related content. Example: For a CALL instruction, the content of the called job is shown. For a work instruction, the content of the current condition file is shown. For an input/output instruction, the input/output status is shown. The lamp on this button lights up while the direct open is ON. While the lamp lights up, press this button to return to the previous window.
	Displays the next page.The page can be switched only when the lamp on this button lights up.
PAGE	[SHIFT] + [PAGE] Switches to the previous page.
[AREA]	Moves the cursor in the display in the
	following order: Menu Area → General- Purpose Display Area → Human Interface Display Area → Main Menu Area. If no item is displayed, the cursor does not move.
	 [SHIFT] + [AREA] Switches the language when the bilingual function is valid. (Bilingual function is optional.) [AREA] + DOWN Moves the cursor from the general-purpose display area to the operation button when the operation button is displayed. [AREA] + UP Moves the cursor to the general-purpose display area when the cursor is on the operation button.
	Changes the functions of other keys by pressing together. Can be used with [SIMPLE MENU], [PAGE], [DIRECT OPEN], [MULTI], [COORD], [AREA], [MOTION TYPE], the cursor, [Numeric Key], [ROBOT], [EX. AXIS], or [AUX] to access alternate functions. Refer to the description of each key for the alternate functions with [SHIFT].
	Changes the functions of other keys by pressing together. Can be used with [TEST START], [FWD], [Numeric Key] (Numeric key customize function), [ROBOT], or [AUX]. Refer to the description of each key for the alternate functions with [INTERLOCK].
[INFORM LIST]	Displays the list of instructions available for editing the job.

[ROBOT]	 Switches the robot axis to be operated. Press this key to enable the robot axis operation. [ROBOT] is enabled for the system with one YRC1000 and multiple manipulators or the system with one or more external axes. [SHIFT] + [ROBOT] The robot axis to be operated is switched to a robot axis which is not registered in the currently selected job. [INTERLOCK] + [ROBOT] Switches the application when multiple applications are
[EX. AXIS]	 Switches the application when multiple applications are set to one robot. Switches the external axis to be operated. Press this key to enable the external axis (base axis or station axis) operation. [EX.AXIS] is enabled for the system with one or more external axes.
	[SHIFT] + [EX. AXIS] The external axis to be operated is switched to an external axis which is not registered in the currently selected job.
[MOTION TYPE]	 Selects the interpolation type for playback operation. The selected interpolation type is shown in the input buffer line in the display. Each time this key is pressed, the interpolation type changes in the following order: MOVJ → MOVL → MOVC → MOVS [SHIFT] + [MOTION TYPE] The interpolation mode changes in the following order: STANDARD → EXTERNAL REFERENCE POINT* →
	CONVEYOR* In each interpolation mode, by pressing only [MOTION TYPE], the usable interpolation method is switched as in the above STANDARD mode. *: These modes are options.
[AUX]	Calls a function.
AUX	[INTERLOCK] + [AUX] Shows the confirmation dialog for enabling/disabling the touch panel. [SHIFT] + [AUX] When the job content is shown the welding line control list function is called. (Only for the arc welding application)

[TEST START]	 Press [TEST START] and [INTERLOCK] simultaneously to move the manipulator through the taught steps in a continuous motion for checking the path. The manipulator moves in the currently selected oper- ation cycle: AUTO, 1 CYCLE, or STEP. The manipulator moves at the taught speed. If the taught speed exceeds the maximum teaching speed, the operation proceeds at the maximum teaching speed.
	[INTERLOCK] + [TEST START] The manipulator moves through the taught steps in a continuous motion. Operation immediately stops when this key is released during the continuous motion.
[FWD]	 Moves the manipulator through the taught steps only while this key is pressed. Only the move instruction is executed. The manipulator moves at the selected manual speed. Before operating the manipulator, make sure that the selected manual speed is set as intended.
	[INTERLOCK] + [FWD] All instructions including the move instruction are executed. [REFP] + [FWD] The manipulator moves to the reference point indicated by the line with the cursor.
[BWD]	 Moves the manipulator through the taught steps in the reverse direction only while this key is pressed. Only the move instruction is executed. The manipulator moves at the selected manual speed. Before operating the manipulator, make sure that the selected manual speed is set as intended.
[DELETE]	 Deletes the registered instruction. Deletion completes when [ENTER] is pressed while the lamp on this key lights up.
[INSERT]	 Inserts a new instruction. Insertion completes when [ENTER] is pressed while the lamp on this key lights up.
	 Modifies the taught position data or instruction. Modification completes when [ENTER] is pressed while the lamp on this key lights up.

1 1.2 Introduction Programming Pendant

[ENTER]	 Completes the execution of each process for registration and edition of instructions, data, current position of the manipulator, etc. When [ENTER] is pressed, the instruction or data shown in the input buffer line moves to the cursor position to complete a registration, insertion, modification, etc.
[MANUAL SPEED]	 Sets the speed for manual operation. This speed is also valid for operations with [FWD] and [BWD]. There are four speed levels (slow, medium, fast, and inching). The speed changes as described below. The selected speed is displayed on the status area. Each time [FAST] is pressed, manual speed changes in the following order: INCH → SLOW → MED → FST. Each time [SLOW] is pressed, manual speed changes in the following order: FST → MED → SLOW → INCH
	Makes the manipulator move at high speed while this key and one of the axis keys are pressed simultaneously during manual operation. No need to change the setting of speed. • The speed for [HIGH SPEED] is specified in advance.
[Axis Key]	 Moves a specific axis of the manipulator. The manipulator operates only while the key is pressed. By pressing two or more keys simultaneously, multiple axes can be operated at the same time. The manipulator operates in the selected coordinate system at the selected manual speed. Before operating the axis, make sure that the selected coordinate system and the manual speed are set as intended. A user-selected external axis can be allocated to [E-], [E+], [8-], or [8+]. For details, refer to <i>chapter 6.9 "Jog Key Allocation"</i>.
[Numeric Key] 7 8 9 4 5 6 1 2 3 0	 Enters the number or symbol on the key when the prompt ">" appears on the input line. "." is the decimal point. "-" is a minus sign or hyphen. [Numeric Keys] are also used as function keys. Refer to the explanation of each function for details.

- 1.2 Programming Pendant

1.2.4 Programming Pendant Display

The programming pendant display is a 5.7 inch color display. Alphanumeric characters can be used.

1.2.4.1 Five Display Areas

The general-purpose display area, menu area, human interface display area, and main menu area among the following five areas can be moved by pressing [AREA], or can be selected by directly touching the screen.

Each window displayed during operations is provided with its name on the upper left of the general-purpose display area.

1.2.4.2 General-Purpose Display Area

On the general-purpose display area, various settings and contents such as jobs and characteristics files can be displayed and edited.

Displays also can be switched by scrolling the window, moving the cursor and switching pages.

Character strings can be copied or the window can be zoomed in/out by touch operation.

Scrolling the window

If the display content is oversized in the general-purpose display area, the display area can be resized by scrolling the window.

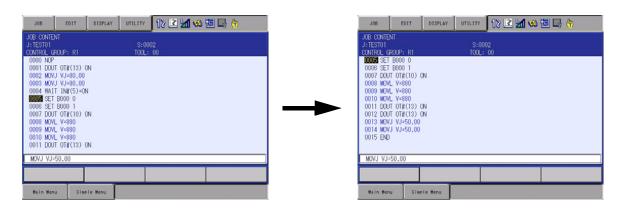

Follow the procedure below to scroll the window.

- Scrolling the window using the cursor: Refer to *chapter 1.2.3 "Programming Pendant Keys"*.
- Scrolling the window by touch operation: While touching the general-purpose display area, move it up and down or sideways, and release the touch.

To enable or disable scrolling the window by touch operation, select {DISPLAY SETUP} - {TOUCH OPE. SETTING} and make the setting.

<Example>

Touch the job window and slide it upwards. (The window scrolls towards the lower part.)

- 1 Introduction
- 1.2 Programming Pendant

Moving the cursor

The cursor are displayed on some windows. Follow the procedure below to move the cursor position.

- Moving the cursor using the cursor: Refer to *chapter 1.2.3 "Programming Pendant Keys"*.
- Moving the cursor by touch operation: Touch the position available for cursor moving in the general-purpose display area, and release the touch. To enable or disable moving the cursor by touch operation, select {DISPLAY SETUP} - {TOUCH OPE. SETTING} and specify the setting.

To move the cursor by touch operation in the job window, select one of the following methods:

- A. Pressing [INTERLOCK] + touch operation
- B. Touch operation + confirmation dialog
- C. Not use touch operation to move the cursor

A. Method of "pressing [INTERLOCK] + touch operation"

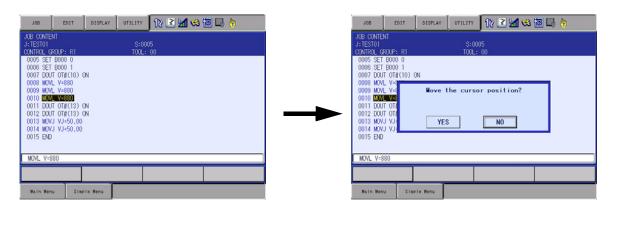

- 1. Set pressing [INTERLOCK] as the method for moving the cursor by touch operation in the job window.
- 2. While pressing [INTERLOCK], touch a position in the job window where the cursor can move.

Page switching

When the [PAGE] lamp lights up, the pages can be switched.

Select one of the following methods to switch the pages.

- Page switching by [PAGE]: Refer to *chapter 1.2.3 "Programming Pendant Keys"*.
- Displaying the next page by touch operation: While touching the general-purpose display area, move it to the left side and release it.
- Displaying the previous page by touch operation: While touching the general-purpose display area, move it to the right side and release it.
- To enable or disable page switching by touch operation, select {DIS-PLAY SETUP} - {TOUCH OPE. SETTING} and specify the setting.

1.2 Programming Pendant

Copy and paste of a character string

Character strings in the general-purpose display area can be copied by touch operation. The copied character string can be pasted on the "Result" of the character input keypad.

Copy a character string by the following procedure:

1. Touch and hold a character string in the general-purpose display area.

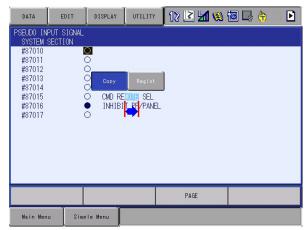

- Selection menu appears.

Operation buttons

On some windows, an operation button appears.

To perform the operation allocated to the operation button, press [SELECT] or touch the operation button.

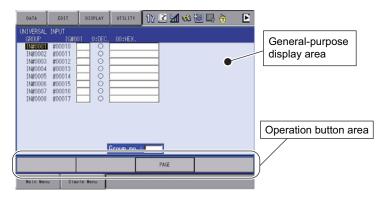

To move the cursor from the general-purpose display area to the operation button, press [AREA] + [\downarrow].

To move the cursor from the operation button to the general-purpose display area, press [AREA] + [\uparrow] or press [CANCEL].

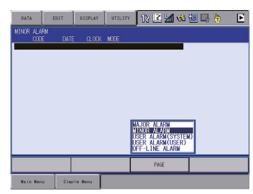

In the operation button area, press [\leftarrow] or [\rightarrow] to move the cursor and press [SELECT] to perform the operation where the cursor is located.

EXECUTE	: Continues operation of the contents displayed in the general-purpose display area.
CANCEL	: Cancels the contents displayed in the general-purpose display area, and returns to the previous window.

- COMPLETE : Completes the setting operation displayed in the general-purpose display area.
- STOP : Stops loading, saving, or verifying in the external memory device.
- RELEASE : Releases the overrun and shock sensor function.
- RESET : Resets an alarm. (Cannot reset major alarms.)
- PAGE : On a switchable page, press {PAGE} and directly enter a desired page number, and then press [ENTER] to switch to the desired page.

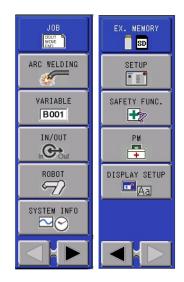

On a window where a list appears, press $[\downarrow]$ or $[\uparrow]$ to select a desired item on the list, and press [ENTER] to show the desired item.

1.2.4.3 Main Menu Area

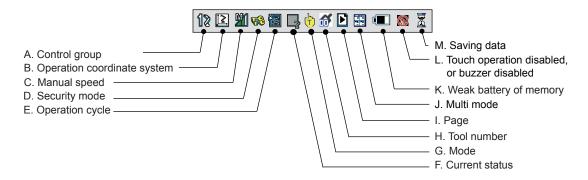

Menus and submenus are displayed in the main menu area. Press [MAIN MENU] or touch {Main Menu} on the bottom left of the window to display the main menu.

- 1 Introduction
- 1.2 **Programming Pendant**

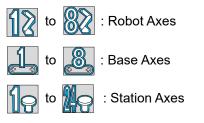

1.2.4.4 Status Display

The status display area shows controller status. The displayed information will vary depending on the controller mode (Play/Teach).

A. Control Group

Displays the active control group when the robot system includes a station axis, two or more robot axes, etc.

B. Operation Coordinate System

Displays the selected coordinate system. Switched by pressing [COORD].

- : Cartesian Coordinates
- : Cylindrical Coordinates
- : Tool Coordinates
- : User Coordinates
- Teaching Line Coordinates (arc welding purpose)

1.2 Programming Pendant

C. Manual Speed

Displays the selected speed for axis operation. For details, refer to *chapter 2.2.0.5* "Select Manual Speed".

: Management Mode

: One Time Manage Mode

E. Operation Cycle

Displays the present operation cycle.

C : Cycle

- 1 Introduction
- 1.2 Programming Pendant

F. Current Status

Displays the current status of the system (STOP, HOLD, ESTOP, ALARM, or RUN).

G. Mode

H. Tool Number

From 🕕 to 🕞

: Displays the tool No. selected by the robot when the tool No. switching function is enabled. (S2C431=1)

I. Page

: Displayed when the page can be switched.

J. Multi Mode

: Displayed when the multi window mode is set.

K. Weak Battery of Memory

: Displayed when the battery of memory is weak.

1.2 **Programming Pendant**

L. Touch Operation Disabled, or Buzzer Disabled

: Displayed the touch panel operation is disabled.

: Displayed when the battery of memory is weak

and the touch operation is disabled.

: Displayed when the pendant buzzer function is disabled.

: Displayed when the battery of memory is weak and

the pendant buzzer function is disabled.

The data of the disabling touch panel operation is displayed when the touch panel operation and the pendant buzzer function are disabled.

M. Saving Data

: Displayed while saving the data.

1.2.6 Character Input Operation

Move the cursor to the data for which characters are to be input, and press [SELECT] to display the software keypad.

1.2.6.1 Character Input

To input characters, the software keypad is shown on the programming pendant display.

There are three types of software keypads: the alphanumeric keypads each for upper-case and lower-case characters and the symbol keypad. To switch between the alphanumeric keypads and the symbol keypad, touch the button tab on the screen or press [PAGE]. To switch the alphanumeric keypads between upper-case and lower-case characters, touch "CapsLock OFF" or "CapsLock ON".

1.2.6.2 Operation

Keypad	Key on the programming pendant	Description
Cursor		Moves the cursor (focus).
[SELECT]	SELECT	Selects a character.
[CANCEL]	CANCEL	Clears all the characters being typed. Press this key two times to close the software keypad.
[ENTER]	ENTER	Enters the input characters.
Button Tab	CO BACK PAGE	Switches the keypads displayed on the programming pendant.
-		Closes the software keypad.
Numeric Key	to	Enters numbers.
	9	

- 1 Introduction
- 1.2 Programming Pendant

1.2.6.3 Alphanumeric Input

Number input is performed with the [Numeric Key] or on the following alphanumeric input window. Numbers include 0 to 9, the decimal point (.), and the minus sign/hyphen (-).

Depending on the contents to be input, some characters may be restricted. If a registered word includes a restricted character, the word cannot be used.

e.g., No lower-case character or decimal point can be used for a job name.

Press [PAGE] to display the alphanumeric input window.

Move the cursor to a desired character and press [SELECT] to enter the character.

1.2.10 Backlight Auto OFF

If no key or touch operation is performed on the programming pendant for 10 minutes, the backlight will automatically turn OFF to reduce power consumption.

However, if an alarm has occurred, the backlight will not automatically turn OFF, even if there has been no key or touch operation for 10 minutes.

If a key or touch operation was performed while the backlight on the programming pendant was OFF, the backlight will turn ON again. However, the first key or touch operation turns ON the backlight only. It performs no other operation.

	1 Introduction 1.3 Mode				
1.	Mode				
	The following three modes are available for YRC1000.				
	• Teach Mode				
	• Play Mode				
	Remote Mode				
1.3.1 Teach Mode					
	In the teach mode, the following can be done.				
	 Preparation and teaching of a job 				
	Modification of a registered job				
	 Setting of various characteristic files and parameters 				
1.3.2 Play Mode					
	In the play mode, the following can be done.				
	Playback of a taught job				
1.3.3 Remote Mode					
	In the remote mode, the operations such as Servo ON Ready, Start, Cycle Change, Call Master Job can be commanded by external input signals.				
	The operations by external input signals become enabled in the remote mode, while [START] on the programming pendant becomes disabled.				
	The data transmission function (optional function) is also available in the remote mode.				
	The following table shows how each operation is input in each mode.				
	Mode Teach Mode Play Mode Remote Mode Operation Operatio				

Mode	Teach Mode	Play Mode	Remote Mode	
Operation		-		
Servo ON Ready	PP	PP	External input signal	
Start	Invalid	PP	External input signal	
Cycle Change	PP	PP	External input signal	
Call Master Job	PP	PP	External input signal	
Nate: "DD" indicates the presumming pendent				

Note: "PP" indicates the programming pendant.

1.3.4 Teach Mode Priority

In the teach mode, the following operations are disabled.

- Playback using [START]
- Playback from external input signals

- 1 Introduction
- 1.4 Security Mode

1.4 Security Mode

1.4.1 Types of Security Modes

The following five types of security modes are available for YRC1000.

Operation Mode

The operator can monitor the line operation and start and stop the manipulator. Repairs, etc. can be performed if any abnormalities are detected.

• Edit Mode

Teaching, robot jog operations, and editing of jobs and various condition files can be performed in addition to the operations enabled in the operation mode.

Management Mode

The operator who performs setup and maintenance for the system can set the machine control parameter, set the time, change the password, etc. in addition to the operations enabled in the edit mode.

Safety Mode

The operator who performs the safety management of the system can edit the files related to the safety function in addition to the operations enabled in the management mode. When the functional safety function (optional) is enabled, the security is changed to the safety mode in which files such as tool files can be edited. For the details of the safety mode, refer to "YRC1000 OPTIONS INSTURC-TIONS FOR FUNCTIONAL SAFETY BOARD OPERATION".

• One Time Manage Mode

Maintenance operations in a higher security mode than the management mode can be performed. The one time security code provided by your YASKAWA representative is required. Restriction of the loading of the batch data (CMOS.BIN)/parameter batch (ALL.PRM)/function definition parameter (FD.PRM) is released in addition to the operations enabled in the safety mode.

Any operation in the edit mode, the management mode, and the security mode requires a password.

In the edit mode and the management mode, the password must consist of 4 to 16 numbers or symbols.

In the safety mode, the password must consist of 9 to 16 numbers or symbols.

- 2 Manipulator Coordinate Systems and Operations
- 2.1 Control Groups and Coordinate Systems

2 Manipulator Coordinate Systems and Operations

2.1 Control Groups and Coordinate Systems

2.1.1 Control Group

For the YRC1000, a group of axes to be controlled at a time is called "Control Group", and the group is classified into three units: "ROBOT" as a manipulator itself, "BASE" that moves the manipulator in parallel, and "STATION" as jigs or tools other than "ROBOT" and "BASE". BASE and STATION are also called external axes.

It corresponds to the servo track.

It controls the path of traveling manipulators.

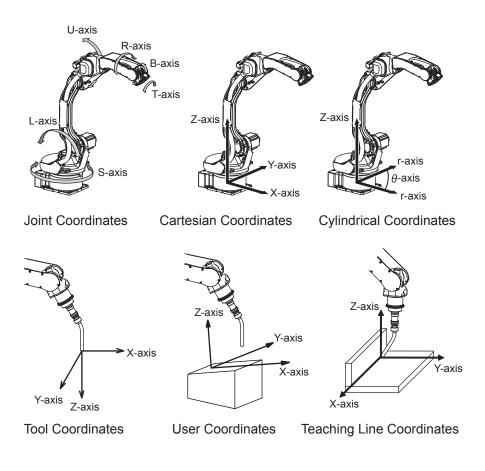

- 2 Manipulator Coordinate Systems and Operations
- 2.1 Control Groups and Coordinate Systems

2.1.2 Types of Coordinate Systems

The following coordinate systems can be used to operate the manipulator:

- Joint Coordinates Each axis of the manipulator moves independently.
- Cartesian Coordinates The tool tip of the manipulator moves parallel to any of the X-, Y-, and Z-axes.
- Cylindrical Coordinates The θ axis moves around the S-axis. The r-axis moves parallel to the L-axis arm. For vertical motion, the tool tip of the manipulator moves parallel to the Z-axis.
- Tool Coordinates The effective direction of the tool mounted in the wrist flange of the manipulator is defined as the Z-axis. This axis controls the coordinates of the end point of the tool.
- User Coordinates The XYZ-Cartesian coordinates are defined at any point and angle. The tool tip of the manipulator moves parallel to the axes of them.
- Teaching Line Coordinates

The XYZ-Cartesian coordinates will be set from two steps and the Zaxis direction of the robot coordinates. The tool tip of the manipulator moves parallel to the coordinates. They can be used only for an arc welding purpose.

- 2 Manipulator Coordinate Systems and Operations
- 2.2 General Operations

2.2 General Operations

2.2.0.1 Check Safety

Before any operation of the YRC1000, read Section 1 "Safety" of "YRC1000 INSTRUCTIONS" again and keep safe around the robot system or peripherals.

2.2.0.2 Select Teach Mode

Set the mode switch on the programming pendant to "teach".

2.2.0.3 Select Control Group

If the YRC1000 has several Control Groups or Coordinate Control Systems (optional function), select control group first.

If two or more ROBOT, BASE, STATION are registered, switch control group by pressing [SHIFT] + [ROBOT] or [SHIFT] + [EX. AXIS].

After selecting a job, the control group registered in the selected job is enabled. The control group registered in the edit job can be switched by pressing [ROBOT] or [EX. AXIS].

Check the selected control group at the status display area on the programming pendant.

2.2.0.4 Select Coordinate System

Select a coordinate system by pressing [COORD].

Each time [COORD] is pressed, the coordinate system switches in the following order:

Joint \rightarrow Cartesian (Cylindrical) \rightarrow Tool \rightarrow User \rightarrow Teaching Line (only for arc welding purpose).

Check the selected coordinate on the status display area on the programming pendant.

- 2 Manipulator Coordinate Systems and Operations
- 2.2 General Operations

2.2.0.5 Select Manual Speed

Select manual speed of operation by pressing [FAST] or [SLOW]. The selected speed is effective not only for axis operation but [FWD] or [BWD] operation.

In operating the manipulator manually by the programming pendant, the maximum speeds of the center point and the flange are limited to 250 mm/s.

• Each time [FAST] is pressed, the speed switches in the order of "INCH"→"SLOW"→"MED"→"FAST".

• Each time [SLOW] is pressed, the speed switches in the order of "FAST"→"MED"→"SLOW"→"INCH".

2.2.0.6 Select Manual Speed (Pitch Jogging Speed)

When PITCH JOG OPERATION is valid in {SETUP} - {JOG CONDITION SETTING}, jogging operations can be performed by switching between inching and pitch jogging.

	 The switching conditions for pitch jogging are as follows: 				
	1. PITCH JOG OPERATION is valid.				
	2. "ROBOT" is set in the control group.				
	 The operation coordinates are set to an option other than "Joint Coordinates" and "Teaching Line Coordinates". 				
	4. "INCH" is set in the motion speed.				
SUPPLE -MENT	 The pitch jogging speed levels are "LOW", "MIDDLE", and "HIGH". 				
	 If [FWD] and [BWD] are used when PITCH JOG OPERA- TION is valid, pitch jogging is canceled and the forward and backward operations are performed. The motion speed at this time is low speed and not the speed that was specified by the pitch jogging speed. 				
	 Pitch jogging cannot be used on multiple axes at the same time. 				

- 2 Manipulator Coordinate Systems and Operations
- 2.2 General Operations
- 1. The JOG CONDITION SETTING window appears. Set PITCH JOG OPERATION to valid.

2.2.0.7	Servo ON	
		Press [SERVO ON READY], and then SERVO ON LED starts blinking.
		Squeeze the Enable Switch, and then SERVO ON LED starts lighting.
2.2.0.8	Axis Operation	
		Make sure of safety around the manipulator.
		Press [Axis Key] then axis moves according to the selected control group, coordinates, and manual speed. See <i>chapter 2.3 "Coordinate Systems and Axis Operation"</i> .
2.2.0.9	HIGH SPEED	
		Press [HIGH SPEED] while pressing [Axis Key] to make the manipulator move faster than the usual speed.
		The [UICH SPEED] is disabled when "INCH" is selected for

The [HIGH SPEED] is disabled when "INCH" is selected for the manual speed.

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

2.3 Coordinate Systems and Axis Operation

2.3.1 Joint Coordinates

When the manipulator is operating in the joint coordinates, each axis of the manipulator can be moved independently.

If the [Axis Key] of an axis not included in the manipulator is pressed, no axis operates.

The motion of each axis is described in the table below.

Axis Na	me	Axis Operation Key	Motion
Major Axes	S-axis	X-X+ S- X+ S+	Main unit rotates right and left.
	L-axis	Y-Y+ L-Y+	Lower arm moves forward and backward.
	U-axis	Z- U- U+ U+	Upper are moves up and down.
Wrist Axes	R-axis	X-r	Wrist rolls right and left.
	B-axis	Y- B- B+	Wrist moves up and down.
	T-axis		Wrist turns right and left.
	E-axis	(E-) (E+)	Lower arm turns right and left.

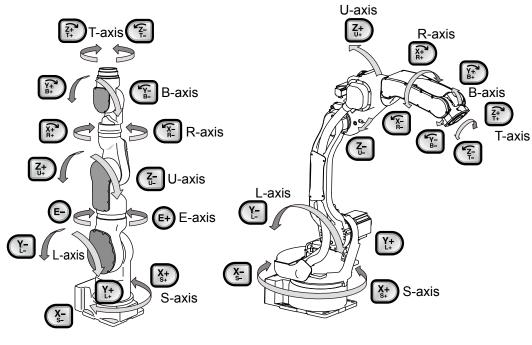

Table 2-1: Axis Motion in Joint Coordinates

Axis Operation in the Joint Coordinates

 When two or more [Axis Keys] are pressed at the same time, the manipulator performs a combined movement. However, if two different directional keys (such as [S -] + [S +]) for the same axis are pressed at the same time, the axis will not operate. (When [S -] + [S +] + [L +] are pressed, only the axis corresponding to [L +] will operate.)

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

7-Axis Manipulator

6-Axis Manipulator

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

2.3.2 Cartesian Coordinates

In the Cartesian coordinates, the manipulator moves parallel to the X-, Y-, or Z-axes.

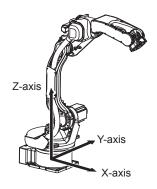

The motion of each axis is described in the table below.

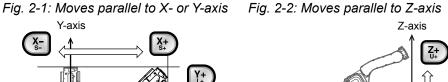

Table 2-2: Axis Motion in Cartesian Coordinates

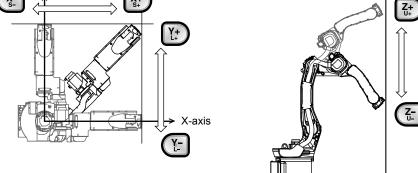

Axis Name		Axis Operation Key	Motion	
Basic Axes			Moves parallel to X-axis.	
	Y-axis	Y-Y+	Moves parallel to Y-axis.	
	Z-axis	Z- U- U+ U+	Moves parallel to Z-axis.	
Wrist Axes		Motion about TCP is executed. See chapter 2.3.7 "Motion about TCP".		

Axis Operation in the Cartesian Coordinates

• When two or more [Axis Keys] are pressed at the same time, the manipulator performs a combined movement. However, if two different directional keys (such as [X -] + [X +]) for the same axis are pressed at the same time, the axis will not operate. (When [X -] + [X +] + [Y +] are pressed, only the axis corresponding to [Y +] will operate.)

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

2.3.3 Cylindrical Coordinates

In the cylindrical coordinates, the manipulator operates in a rotational movement, a perpendicular movement, or a parallel movement with respect to the Z-axis.

The motion of each axis is described in the table below.

Table 2-3: Axis Motion in Cylindrical Coordinates

Axis Name		Axis Operation Key	Motion	
Basic θ-axis Axes		X-X+ S+	Main unit rotates with respect to Z-axis.	
	r-axis	¥-Y+	Moves perpendicular to Z-axis.	
	Z-axis	Z- Z+ U- U+	Moves parallel to Z-axis.	
Wrist Axes		Motion about TCP is executed. See chapter 2.3.7 "Motion about TCP".		

Axis Operation in the Cylindrical Coordinates

SUPPLE -MENT When two or more [Axis Keys] are pressed at the same time, the manipulator performs a combined movement. However, if two different directional keys (such as [Z -] + [Z +]) for the same axis are pressed at the same time, the axis will not operate. (When [Z -] + [Z +] + [Y +] are pressed, only the axis corresponding to [Y +] will operate.)

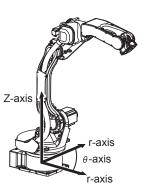

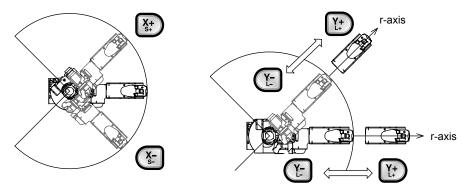

Fig. 2-3: Moves parallel to θ -axis Fig. 2-4: Moves parallel to r-axis

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

2.3.4 Tool Coordinates

In the tool coordinates, the manipulator moves parallel to the X-, Y-, and Zaxes defined with respect to the tip of the tool.

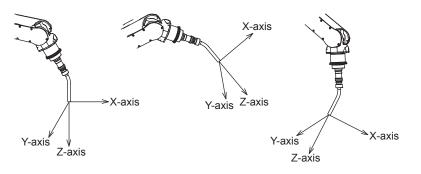

The motion of each axis is described in the table below.

Table 2-4: Axis Motion in Tool Coordinates

Axis Name		Axis Operation Key	Motion
Basic Axes	X-axis	X-X+ S-X+ S+	Moves parallel to X-axis.
	Y-axis	¥- ¥+	Moves parallel to Y-axis.
	Z-axis	Z- Z+ U- U+	Moves parallel to Z-axis.
Wrist Axes		Motion about TCP is executed. See chapter 2.3.7 <i>"Motion about TCP"</i> .	

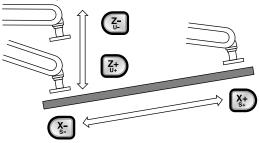

Axis Operation in the Tool Coordinates

• When two or more [Axis Keys] are pressed at the same time, the manipulator performs a combined movement. However, if two different directional keys (such as [X -] + [X +]) for the same axis are pressed at the same time, the axis will not operate. (When [X -] + [X +] + [Y +] are pressed, only the axis corresponding to [Y +] will operate.)

The tool coordinates are defined at the tip of the tool, assuming that the effective direction of the tool mounted on the manipulator wrist flange is the Z-axis. Therefore, the tool coordinates axis direction moves with the wrist.

In the tool coordinates motion, the manipulator can be moved using the effective tool direction as a reference regardless of the manipulator position or orientation. These motions are best suited when the manipulator is required to move parallel while maintaining the tool orientation with the workpieces.

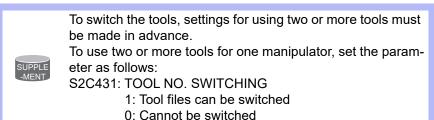

2 Manipulator Coordinate Systems and Operations2.3 Coordinate Systems and Axis Operation

To use the tool coordinates, the tool file must be registered in advance. For further details, refer to "YRC1000 INSTRUCTIONS (RE-CTO-A221) 8.3 Tool Data Setting".

2.3.4.1 Selecting Tool

Tool numbers are allocated to tools when two or more tools are used in the system. Select the desired tool number to switch the tool.

- 1. Press [COORD] and select the tool coordinates
 - Each time [COORD] is pressed, the coordinate system switches in the following order:
 Joint → Cartesian (Cylindrical) → Tool → User → Teaching Line (only for arc welding purpose).

Confirm the selected coordinate system in the status display area.

- 2. Press [SHIFT] + [COORD].
 - The TOOL NO. SELECT window appears.

DATA	EDIT	DISPLAY	UTILITY	12 🗵 📶 👒 t	o 🕞 🕆 🕷
TOOL NO. 5 0 1 2 3 4 5 6 7 7 8 9 10 11 12 13 14	ELECT MT-3501 : MT-3502 : TOOL02 : TOOL03 : : : : : : : : : : : : : : : : : : :				
Main Men	u Simp	le Menu			

- 3. Move the cursor to the tool to use.
 - As an example, the TOOL NO. SELECT window above indicates that the tool number 0 (torch MT-3501) is selected.
- 4. Press [SHIFT] + [COORD].
 - The window goes back to the previous window.

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

2.3.5 User Coordinates

In the user coordinates, the manipulator moves parallel to each axis of the coordinates predetermined by the user. The user must preset the X-, Y-, and Z-axes with desired slopes at a desired position within the manipulator's motion range. Up to 63 types of the user coordinates can be registered, and each has a user coordinates number and is called a user coordinates file.

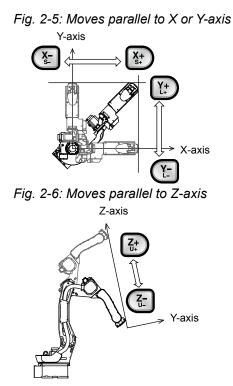

The motion of each axis is described in the table below.

Table 2-5: Axis Motion in User Coordinates

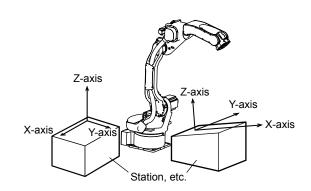

Axis Name		Axis Operation Key	Motion
Basic Axes	X-axis	X-X+ S- X+ S+	Moves parallel to X-axis.
	Y-axis	Y-Y+	Moves parallel to Y-axis.
	Z-axis	Z- Z+ U- U+	Moves parallel to Z-axis.
Wrist Axes		Motion about TCP is executed. See chapter 2.3.7 "Motion about TCP".	

Axis Operation in the User Coordinates

When two or more [Axis Keys] are pressed at the same time, the manipulator performs a combined movement. However, if two different directional keys (such as [X -] + [X +]) for the same axis are pressed at the same time, the axis will not operate. (When [X -] + [X +] + [Y +] are pressed, only the axis corresponding to [Y +] will operate.)

SUPPLE

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

2.3.5.1 Selecting User Coordinates

In the system using two or more user coordinates, select the desired user coordinates for the task from the registered user coordinates.

- 1. Press [COORD], and select the user coordinates
 - Each time [COORD] is pressed, the coordinate system switches in the following order: Joint → Cartesian (Cylindrical) → Tool → User Confirm the selected coordinate system in the status display area.
- 2. Press [SHIFT] + [COORD].
 - The USER COORDINATE window appears.

DATA	EDIT	DISPLAY	UTILITY	12 🗵 📶 👒 🕏	I 🕞 🕆 😚
USER COOR NO.		NAME			
01 02 03 04 05 06 07 08 09 10 11 12 13 14	SET O O O O O O O O O O O O O O O O O O O				
Main Mer	u Sim	ple Menu			

For more information on registration of the user coordinates, refer to "YRC1000 INSTRUCTIONS (RE-CTO-A221) 8.8 User Coordinate Setting".

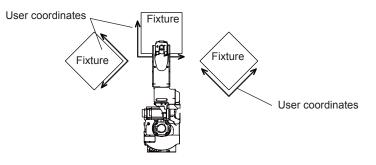

3. Select the number of the desired user coordinates.

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation
- 2.3.5.2 Usage of User Coordinates

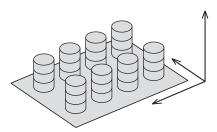

The user coordinates make teaching operations easier.

<Examples>

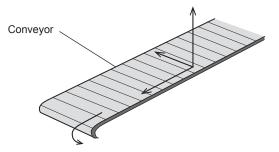

• When two or more fixtures are used, manual operation is simplified by setting the user coordinates for each fixture.

• When performing arranging or stacking operations, the incremental value for parallel shift is easily set by setting the user coordinates on a pallet.

• When performing conveyor tracking operations, the moving direction of the conveyor is specified.

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

2.3.6 External Axis

The external axis can be operated by selecting "BASE" or "STATION" for the control group.

The motion of each axis is described in the table below.

Axis Name		Axis Operation Key	Motion
BASE or STATION	1st axis	X- X+ S-	The 1st axis moves.
	2nd axis	¥-¥+	The 2nd axis moves.
	3rd axis	Z- Z+ U- U+	The 3rd axis moves.

2.3.7 Motion about TCP

In the motion about TCP (Tool Center Point), the manipulator's posture can be changed without changing the position of the tool's tip (TCP).

The motion about TCP is available in the coordinates except the joint coordinates.

The motion of each axis is described in the table below.

Table 2-6: Axis Motion in Motion	about	ТСР
----------------------------------	-------	-----

Axis Name	Axis Operation Key	Motion		
Wrist Axes	X- R- R+	Only the tool's posture changes with the TCP fixed. The tool's posture changes around the axes of the specified coordinates.		
	Y- B- B+			
	2- T- T+			
E-axis		* Available only for the manipulator with seven axes The posture of arm changes while the position and posture of the tool remain fixed. (The Re degree changes.)		

Axis Operation in the Motion about TCP

When two or more [Axis Keys] are pressed at the same time, the manipulator performs a combined movement. However, if two different directional keys (such as [X -] + [X +]) for the same axis are pressed at the same time, the axis will not operate. (When [X -] + [X +] + [Y +] are pressed, only the axis corresponding to [Y +] will operate.)

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

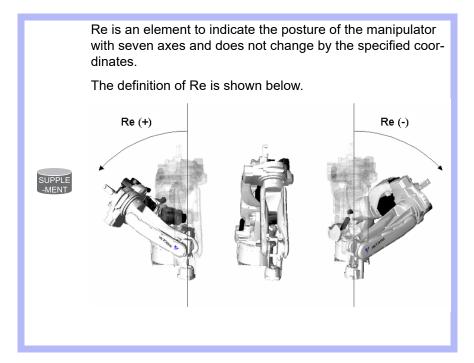

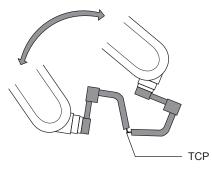

Fig. 2-7: Torch Welding

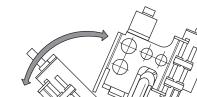

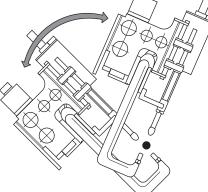

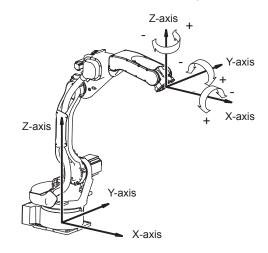

Fig. 2-8: Gun Spot Welding

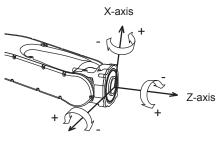

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

Turning of each wrist axis differs in each coordinate system.

• In the Cartesian or cylindrical coordinates, wrist axis rotations are based on the X-, Y-, and Z-axes of the manipulator.

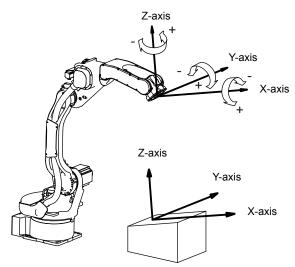

• In the tool coordinates, wrist axis rotations are based on the X-, Y-, and Z-axes of the tool coordinates.

Y-axis

• In the user coordinates, wrist axis rotations are based on the X-, Y-, and Z-axes of the user coordinates.

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

2.3.7.1 Modification of TCP

The tool tip position (TCP) is the target point of axis operations and is registered in a tool file as the distance from the flange face.

Modification of TCP is performed as an axis operation that involves selecting a tool from the list of registered tools (Refer to chapter 2.3.4.1 "Selecting Tool"), and then manipulating the axes while changing the TCP.

Modification of TCP is available in the coordinates except the joint coordinates.

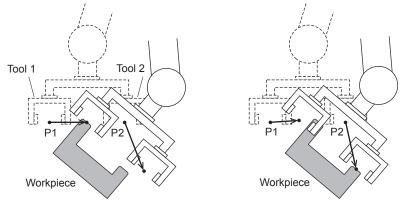

The axis operation after the modification of TCP is the same as that of the motion about TCP.

<Example 1> TCP Modification with Two or More Tools

- (1) Set the TCPs for Tool 1 and Tool 2 as P1 and P2, respectively.
- (2) When Tool 1 is selected to perform an axis operation, P1 (Tool 1's TCP) is the target point of the operation. Tool 2 only follows Tool 1 and is not controlled by the axis operation.
- (3) When Tool 2 is selected to perform an axis operation, P2 (Tool 2's TCP) is the target point of the axis operation. Tool 1 only follows Tool 2.

operating axes with respect to P2 as TCP

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

<Example 2> TCP Modification with One Tool

- (1) Set the two corners of the workpiece which the tool is holding as TCP P1 and P2.
- (2) By selecting two TCPs alternately, the workpiece moves as shown below.

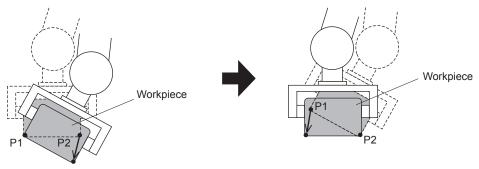

Fig. 2-12: Selecting P2 and perform motion about TCP

For registration of the tool file, refer to "YRC1000 INSTRUC-TIONS (RE-CTO-A221) 8.3 Tool Data Setting"

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

2.3.8 Teaching Line Coordinates

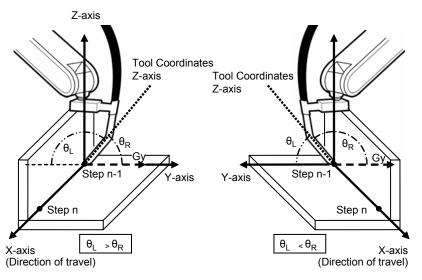

The teaching line coordinates is the coordinates that are set from the two successive steps and the Z-axis direction of the robot coordinates.

The teaching line coordinates can be used only for the arc welding.

Axis Name	Motion	Axis Operation Key
X-axis	Direction of travel Tangential direction in a circular arc path	X- X-
Y-axis	Perpendicular direction with respect to the welding line (direction of travel) and the Z-axis of base coordinates	Y- B-
	 Gy is outer product direction of the Z-axis of base coordinates and the X-axis of teaching line coordinates. θR is the angle of Gy and the Z-axis of tool coordinates. θL is the angle of -Gy and the Z-axis of tool coordinates. When θR is smaller than θL, the Y-axis of teaching line coordinates is Gy. When θL is smaller than θR, the Y-axis of teaching line coordinates is -Gy. 	
Z-axis	Perpendicular direction with respect to the welding line (direction of travel) and the Y-axis of teaching line coordinates The Z-axis of teaching line coordinates is the outer product direction of the X-axis of base coordinates and Gy.	2-

X-, Y-, and Z- axes of the teaching line coordinates

Fig. 2-13: Teaching Line Coordinates

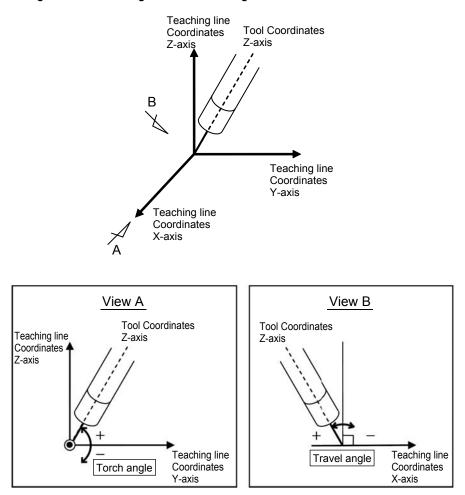

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

Torch Angle and Travel Angle

Torch angle and travel angle of the teaching line coordinates

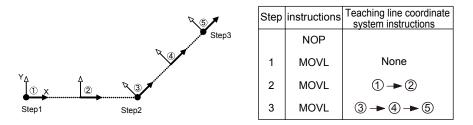

Name	Motion	Axis Operation Key
Torch angle	The angle made between the Z-axis of tool coordinates projected on the YZ-plane of teaching line coordinates and the Y-axis of teaching line coordinates.	
Travel angle	The angle subtracted 90 degrees from the angle made between the X-axis of teaching line coordinates and the Z-axis of tool coordinates.	Y- B- R+ B+

Fig. 2-14: Torch Angle and Travel Angle

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

Fig. 2-15: Linear Interpolation and the Teaching Line Coordinates

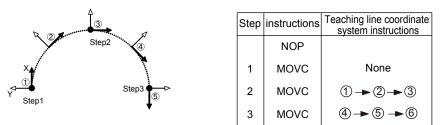

At the steps in circular interpolation or spline interpolation, if axis operation is performed in the teaching line coordinates without previously performing FWD, BWD, or test operation, the following message appears and the axis operation cannot be completed.

"Execute Test run or FWD operation before perform jog operation."

Perform test operation, FWD operation, etc., and then perform axis operation.

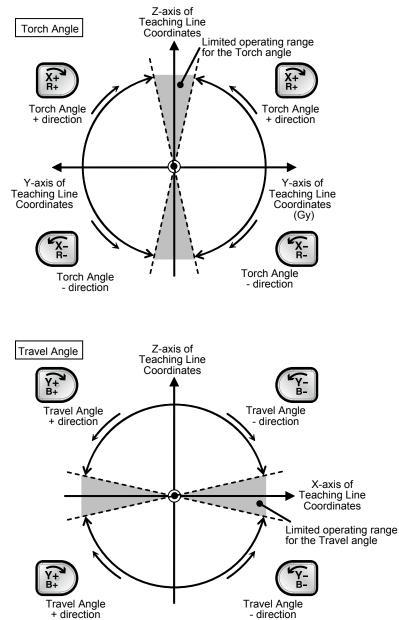

Fig. 2-16: Circular Interpolation and the Teaching Line Coordinates

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

The ranges near +90 degrees and -90 degrees of the torch angle and the travel angle are movement-prohibited areas. If entry into one of these areas is attempted, the following message appears:

"Jog operation is limited in the area that torch or travel angle is near 90 degree."

At the steps in circular interpolation or spline interpolation, perform FWD, BWD, or test operation, and then perform manual operation.

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

2.3.8.1 Operations for Teaching Line Coordinates

In the teaching line coordinates, manual operation can be performed as follows.

Axis Name		Axis Operation Key	Motion			
Basic Axes	X-axis	X-X+ S-X+ S+	Moves parallel to the X-axis.			
	Y-axis	Y- Y+	Moves parallel to the Y-axis.			
		L- L+	[SHIFT]+[Y-], [SHIFT]+[Y+] Moves parallel to the Gy-axis.			
	Z-axis	Z- Z+	Moves parallel to Z-axis.			
		U- U+	[INTERLOCK]+[Z-], [INTERLOCK]+[Z+] Moves parallel to the Z-axis of tool coordinates.			
Wrist Axes		X- R- X+ R+	The position of TCP is fixed, and the torch angle changes.			
			[SHIFT]+[x-], [SHIFT]+[x+] The position of TCP is fixed, and the tool posture changes around the X-axis.			
		Y- B- B+	The position of TCP is fixed, and the travel angle changes.			
			[SHIFT]+[y-], [SHIFT]+[y+] The position of TCP is fixed, and the tool posture changes around the Gy-axis.			
			The position of TCP is fixed, and the tool posture changes around the Z-axis of tool coordinates.			
			[SHIFT]+[z-], [SHIFT]+[z+] The position of TCP is fixed, and the tool posture changes around the Z-axis.			

Table 2-7: Axis Motion in Teaching Line Coordinates

Axis Operation in the Teaching Line Coordinates

• When two or more [Axis Keys] are pressed at the same time, the manipulator performs a combined movement. However, if two different directional keys (such as [X -] + [X +]) for the same axis are pressed at the same time, the axis will not operate. (When [X -] + [X +] + [Y +] are pressed, only the axis corresponding to [Y +] will operate.)

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

In the following operations and cases, manual operation in the teaching line coordinates is limited.

Condition	Restrictions			
Job is not selected.	The following message appears, and axis operation cannot be performed: "Teach line JOG move not allowed for invalid teach line."			
The number of steps in the JOB is less than 2.				
The cursor is at the 1st step.				
The current step and the previous step are the same position, or the distance between these steps are short.				
Direction of travel is the same as the Z-axis direction of the base coordinates.				
Move instruction of the current step is MOVJ.				
Move instruction of the current step is IMOV.				
The torch angle is about ± 90°.	The following message appears, and the following axis operations cannot be performed: · Y-axis of the teaching line coordinates · Torch angle "Jog operation is limited in the area that torch or travel angle is near 90 degree."			
The travel angle is about ± 90°.	The following message appears, and the following axis operations cannot be performed: · Y-axis of the teaching line coordinates · Torch angle · Travel angle "Jog operation is limited in the area that torch or travel angle is near 90 degree."			

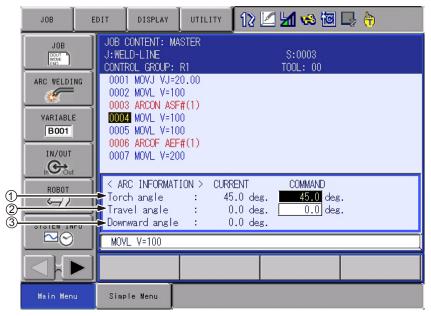

Table 2-8: Limited Manual Operation in Teaching Line Coordinates

- 2 Manipulator Coordinate Systems and Operations
- 2.3 Coordinate Systems and Axis Operation

2.3.8.2 Welding-Related Information Display

Degrees of the angles in the teaching line coordinates are shown in the JOB CONTENT window.

Regarding the movement to the target position ("COMMAND" in the following window), refer to *chapter 2.3.8.3 "Operation of Moving to Torch Angle/Travel Angle"*.

1) Torch angle (-90.000 ~ 90.000)

CURRENT: Degrees of the torch angle of the current teaching line coordinates

2 Travel angle (-90.000 ~ 90.000)

CURRENT: Degrees of the travel angle of the current teaching line coordinates

3 Downward angle (-90.000 ~ 90.000)

CURRENT: Current downward angle

The slope of the direction of travel of the welding line with respect to the plane horizontal to the ground. (Defined by subtracting 90 degrees from the angle made between the Z-axis of the base coordinates and the X-axis of the teaching line coordinates)

In the following operations and cases, ARC INFORMATION for the teaching line coordinates is not displayed:

- Selecting a job
- Editing a job
- · Moving the cursor
- The cursor is at the 1st step.
- The current step and the previous step are the same position, or the distance between these steps are short.
- Move instruction of the current step is MOVJ.
- Move instruction of the current step is IMOV.
- Direction of travel is the same as the Z-axis of the base coordinates.

2 Manipulator Coordinate Systems and Operations

2.3 Coordinate Systems and Axis Operation

Switching Welding-Related Information Display

ARC INFORMATION can be hidden or shown as follows:

- 1. Select {JOB} under the main menu.
- 2. Select {JOB CONTENT}.
 - The JOB CONTENT window appears.
- 3. Select {DISPLAY} in the menu area.
 - A pull-down menu appears.

JOB	E	DIT	DISPLAY	UTILITY		12 🗹 🖬 🏍 🗃 🕞 🙌 👘

2 Manipulator Coordinate Systems and Operations

2.3 Coordinate Systems and Axis Operation

In the multi-window mode, operation of moving to the torch angle/travel angle is unavailable. If [NEXT] is pressed when the cursor is on a move instruction, the next motion of the move instruction is operated.

- 7. Press "YES".
 - The confirmation dialog box disappears.
 - While ARC INFORMATION is activated, the confirmation dialog does not appear again.
- 8. By pressing [NEXT] again, the manipulator moves to the target position.
 - The manipulator stops when the manipulator arrives at the target position.
 - The manipulator stops when [NEXT] is released.

- 3 Teaching
- 3.1 Preparation for Teaching

3.1 Preparation for Teaching

To ensure safety, the following operations should always be performed before teaching:

- Check the emergency stop buttons to be sure they function properly.
- Set the mode switch to "TEACH".

Then,

• Register a job.

3.1.1 Checking Emergency Stop Buttons

The Servo ON button on the programming pendant should be lit while the power is ON for the servo system. Perform the following operation to ensure that the emergency stop buttons on both the YRC1000 and the programming pendant are functioning correctly before operating the manipulator.

- 1. Press [EMERGENCY STOP].
 - Press the emergency stop button on the YRC1000 or the programming pendant.
- 2. Confirm the servo power is turned OFF.
 - The SERVO ON button on the programming pendant lights while servo supply is turned ON.
 - When the emergency stop button is pressed and the servo power is turned OFF, the SERVO ON lamp will turn OFF.
- 3. Press [SERVO ON READY] of the programming pendant.
 - After confirming correct operation, press [SERVO ON READY]. The servo power will be ready to turn ON.
 - The servo power can be turned ON while the SERVO ON button lamp blinks.

3.1.2 Setting the Teach Lock

For safety purposes, always set the mode switch to "TEACH" before beginning to teach.

While the teach lock is set, the mode of operation is tied to the teach mode and the machines cannot be played back using either [START] or external input.

- 3 Teaching
- 3.1 Preparation for Teaching

3.1.3 Registering a Job

Specify the name, comments (as required), and control group to register a job.

3.1.3.1 Registering Job Names

Job names can use up to 32 alphanumeric and symbol characters. These different types of characters can coexist within the same job name.

The following rules apply to the designation of job names:

- A maximum of 32 characters can be used for a job name.
- If the job name is already used, an input error is caused.

<Example>

3.1.3.2 Registering Jobs

- 1. Select {JOB} under {Main Menu}.
 - The sub-menu appears.

	12 🛛 🚺 🔂 😓 👘
	JOB n Menu.
ARC WELDING	SELECT JOB
VARIABLE	CREATE NEW JOB
	MASTER JOB
ROBOT	JOB CAPACITY
SYSTEM INFO	TT CYCLE
Main Menu	Simple Menu

- 2. Select {CREATE NEW JOB}.
 - The NEW JOB CREATE window appears.

JOB	E	DIT	DISPLAY	UTILITY	12	2 🖌	😣 🔞	-	F)

Main Menu		Simp	le Menu						

- 3 Teaching
- 3.1 Preparation for Teaching
- 3. Input job name.
 - Move the cursor to JOB NAME, and press [SELECT]. Input job names using the character input operation. For information on character input operation, refer to *chapter 1.2.6 "Character Input Operation"*.
- 4. Press [ENTER].

3.1.3.3 Registering Comments

Register a comment using up to 32 alphanumeric and symbol characters as required.

- 1. Enter a comment.
 - In the NEW JOB CREATE window, move the cursor to the comment and press [SELECT]. For information on character input operation, refer to *chapter 1.2.6* "Character Input Operation".
- 2. Press [ENTER].

3.1.3.4 Registering Control Groups

Select the control group that has been registered in advance. If external axes (BASE or STATION) or multiple robot systems are not used, the registration of control groups is not required.

- 3 Teaching
- 3.1 Preparation for Teaching

3.1.3.5 Switching to the Teaching Window

After the name, comments (can be omitted), and the control groups have been registered, switch the window to the teaching window as follows.

- In the NEW JOB CREATE window, press [ENTER] or select "EXECUTE".
 - Job name, comments, and control groups are all registered. Then, the JOB CONTENT window appears. NOP and END instructions are automatically registered.

Up to 10000 instructions can be registered per JOB. (Including NOP and END, line 0 to 9999)

Note that the number of registrable instructions is restricted if the JOB capacity is not sufficient, or if the structured program language function, the ARCON instruction (for arc welding), or the SVSPOTMOV instruction (for spot welding using motor gun) is used.

- 3 Teaching
- 3.2 Teaching Operation

3.2 Teaching Operation

3.2.1 Teaching Window

Teaching is conducted in the JOB CONTENT window. The JOB CONTENT window contains the following items:

	JOB	EDIT	DISPLAY	UTILITY	12 🗹 🐋 🗑 🗔 🏠			
	JOB CONTEN J:TESTO1 CONTROL GR			\$:000 TOOL:

	0007 MOVJ 0008 MOVJ							
	0009 MOVJ 0010 MOVJ 0011 END	VJ=100.00						
A. Line numbers								

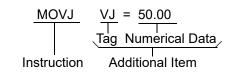

A. Line Numbers

The number of the job line is automatically displayed. Line numbers are automatically updated if lines are inserted or deleted.

B. Cursor

The cursor for manipulator control. For the FWD, BWD, and test operation, the manipulator motion starts from the line this cursor points.

C. Instructions, Additional Items, Comments, Etc.

- Instructions: These are instructions needed to process or perform an
operation. In the case of MOVE instructions, the
instruction corresponding to the interpolation type is
automatically displayed at the time position is taught.Additional items: Speed and time are set depending on the type of
 - ditional items : Speed and time are set depending on the type of instruction. When needed, numerical or character data is added to the condition-setting tags.

3.2 Teaching Operation

3.2.2 Interpolation Type and Play Speed

Interpolation type determines the path along which the manipulator moves between playback steps. Play speed is the rate at which the manipulator moves.

Normally, the position data, interpolation type, and play speed are registered together for a robot axis step. If the interpolation type or play speed settings are omitted during teaching, the data used from the previously taught step is automatically used.

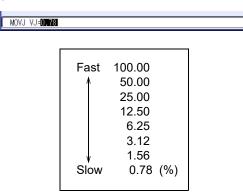

3.2.2.1 Joint Interpolation

The joint interpolation is used when the manipulator does not need to move in a specific path toward the next step position. When the joint interpolation is used for teaching a robot axis, the move instruction is MOVJ. For safety purposes, use the joint interpolation to teach the first step.

When [MOTION TYPE] is pressed, the move instruction on the input buffer line changes.

<Play Speed Setting Window>

- Speeds are indicated as percentages of the maximum rate.
- Setting "0: Speed Omit" sets the same speed as the previous determination.
- 1. Move the cursor to the play speed.
- 2. Set the play speed by pressing [SHIFT] + the cursor.
 - The joint speed value increases or decreases.

- 3 Teaching
- 3.2 Teaching Operation

3.2.2.2 Linear Interpolation

The manipulator moves in a linear path from one taught step to the next. When the linear interpolation is used to teach a robot axis, the move instruction is MOVL. Linear interpolation is used for work such as welding. The manipulator moves automatically changing the wrist position as shown in the figure below.

<Play Speed Setting Window (same for circular and spline interpolation)>

- There are two types of displays, and they can be switched depending on the application.
- 1. Move the cursor to the play speed.
- 2. Set the play speed by pressing [SHIFT] + the cursor.
 - The play speed value increases or decreases.

MOVL V-88]
Fast 1500.0	Fast 9000
↑ 750.0	↓ 4500
375.0	2250
187.0	1122
93.0	558
46.0	276
23.0	↓ 138
Slow 11 (mm/s)	Slow 66 (cm/min)

VMAX speed

This is the play speed which is specified as the rate with respect to the maximum speed of each axes. This tag can be added to MOVL (linear interpolation). For example, if VMAX=100 is set, the linear interpolation motion is performed at the TCP speed without exceeding the maximum speed of each axes. If VMAX=50 is set, the motion is performed at the half speed of TCP speed when VMAX=100 is set.

Notes for VMAX speed

If VMAX speed is specified, TCP speed may not be stable since the speed of each axes is controlled not to exceed the maximum speed during operation.

Thus, VMAX speed must be used in the case where the motion with the stable speed is not required for the operation. Also, VMAX speed is not changed by operation for speed modification, TRT and PAM function.

3.2 Teaching Operation

3.2.2.3 Circular Interpolation

The manipulator moves in an arc that passes through three points. When circular interpolation is used for teaching a robot axis, the move instruction is MOVC.

■ Single Circular Arc

When a single circular movement is required, teach the circular interpolation for three points, P1 to P3, as shown in the following figure.

If joint or linear interpolation is taught at P0, the point before starting the circular operation, the manipulator moves from P0 to P1 in a straight line.

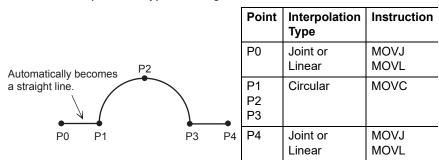

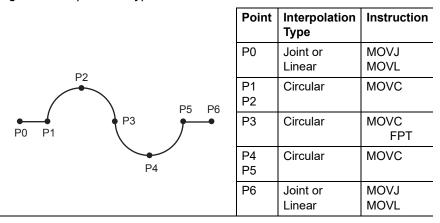

Table 3-1: Interpolation Type for Single Circular Arc

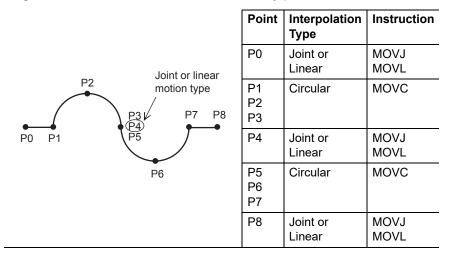

Continuous Circular Arcs

When two or more successive circular movements with different curvatures are required, the movements can be continuously performed by adding an "FPT" tag to the step whose curvature is needed to be changed.

- 3 Teaching
- 3.2 Teaching Operation

If not adding an "FPT" tag, the successive circular movements must be separated from each other, thus add a joint or linear interpolation step (P4) at a connecting point of the preceding movement and the following movement. However, when the steps at the same connecting point are taught, the movements cannot be continuously performed.

<Play Speed>

- The play speed set display is identical to that for the linear interpolation.
- The speed taught at P2 is applied from P1 to P2. The speed taught at P3 is applied from P2 to P3.
- If a circular operation is taught at high speed, the actual arc path has a shorter radius than that taught.

3.2 Teaching Operation

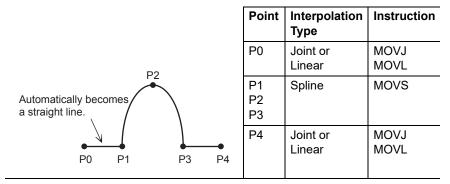

3.2.2.4 Spline Interpolation

When performing operations such as welding, cutting, and applying primer, using the spline interpolation makes teaching for workpieces with irregular shapes easier. The path of motion is a parabola passing through three points. When spline interpolation is used for teaching a robot axis, the move instruction is MOVS.

■ Single Spline Curve

When a single spline curve movement is required, teach the spline interpolation for three points, P1 to P3, as shown in the figure below. If joint or linear interpolation is taught at point P0, the point before starting the spline interpolation, the manipulator moves from P0 to P1 in a straight line.

Continuous Spline Curves

The manipulator moves through a path created by combining parabolic curves. This differs from the circular interpolation in that steps at an identical point or an FPT tag is not required at the connecting point between two spline curves.

	Point	Interpolation Type	Instruction
P2 Identical-point	P0	Joint or Linear	MOVJ MOVL
step not required	P1 to P5	Spline	MOVS
P0 P1	P6	Joint or Linear	MOVJ MOVL

Table 3-3: Interpolation Type for Continuous Spline Curves

When the parabolas overlap, a composite motion path is created.

- 3 Teaching
- 3.2 Teaching Operation

<Play Speed>

- The play speed setting window is identical to that for the linear interpolation.
- As with the circular interpolation, the speed taught at P2 is applied from P1 to P2, and the speed taught at P3 is applied from P2 to P3.

Teach points so that the distances between the three points are roughly equal. If there is any significant difference, an error will occur on playback and the manipulator may operate in an unexpected, dangerous manner. Ensure that the ratio of distances between steps m:n is within the range of 0.25 to 0.75.

P3

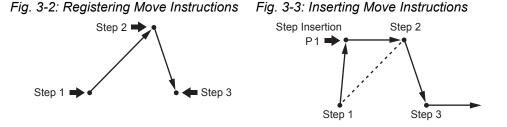

- 3 Teaching
- 3.2 Teaching Operation

3.2.3 Teaching Steps

3.2.3.1 Registering Move Instructions

Whenever one step is taught, one move instruction is registered. There are two ways to teach a step. Steps can be taught in sequence as shown in the following left figure *fig.* 3-2 *"Registering Move Instructions"* or they can be done by inserting steps between already registered steps, as shown in the right figure *fig.* 3-3 *"Inserting Move Instructions"*

This paragraph explains the teaching of *fig. 3-2 "Registering Move Instructions"*, the operations involved in registering new steps.

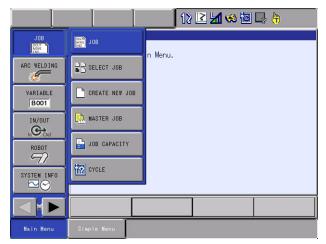

Teaching of *fig.* 3-3 "Inserting Move Instructions" is called "Inserting move instruction", to distinguish it from the method shown in *fig.* 3-2 "Registering Move Instructions". For more details on this operation, see chapter 3.4.2 "Inserting Move Instructions". The basic operations for registration and insertion are the same. The only difference is pressing [INSERT] in the case of insertion. For registration (*fig.* 3-2 "Registering Move Instructions"), the instruction is always registered before the END instruction. Therefore, it is not necessary to press [INSERT]. For insertion (*fig.* 3-3 "Inserting Move Instructions"), [INSERT] must be pressed.

3.2 Teaching Operation

Setting the Position Data

- 1. Select {JOB} under {Main Menu}.
 - The sub-menu appears.

- 2. Select {JOB}.
 - The contents of the currently-selected job is displayed.

JOB	EDIT DISPLAY		2 🖌 😣 🔟	-

- 2. Move the cursor to the desired tool number.
 - The currently-selected tool number by the cursor is displayed.
- 3. Press [SHIFT] + [COORD].
 - The JOB CONTENT window appears.

Using Multiple Tools with One Manipulator

• When multiple tools are to be used with one manipulator, set parameter S2C431 to 1.

• See *chapter 2.3.4 "Tool Coordinates"* for details on this operation.

Setting the Interpolation Type

- 1. Press [MOTION TYPE].
- 2. Select the desired interpolation type.
 - When [MOTION TYPE] is pressed, MOVJ→MOVL→MOVC→ MOVS are displayed in order in the input buffer line.

Setting the Play Speed

1. Move the cursor to the instruction.

0000	NOP				
0001	MOVJ	VJ=0.78			
0002	END				

- 2. Press [SELECT].
 - The cursor moves to the input buffer line.

MOWJ VJ=0.78

3. Move the cursor to the play speed to be set.

MOVJ VJ=<mark>0.78</mark>

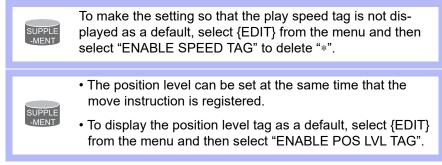

- 3 Teaching
- 3.2 Teaching Operation
- 4. Press [SHIFT] + the cursor [\uparrow] or [\downarrow] simultaneously.
 - The joint speed moves up and down.

- The MOV instruction is registered.

Follow the above instructions when conducting teaching. (Tool number, interpolation type, or play speed does not need to be set if it is same as the previous step.)

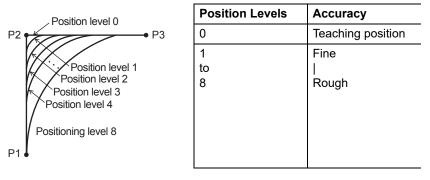

Position Level: The position level is the degree of approximation of the manipulator to a taught position.

The position level can be added to move instructions MOVJ (joint interpolation) and MOVL (linear interpolation).

If the position level is not set, the precision depends on the operation speed. Setting an appropriate level moves the manipulator in a path suitable to circumferential conditions and the workpiece.

The relationship between path and accuracy for position levels is as follows.

- 3 Teaching
- 3.2 Teaching Operation

Setting the Position Level

- 1. Select move instruction.
 - The DETAIL EDIT window appears.

JOB	EDIT	DISPLAY	UTILIT	12 🗹 📶 🐋	🖻 🖵 🙌
DETAIL EDIT MOVJ					
JOINT SPEED POS LEVEL NMAIT UNTIL ACCEL RATIO DECEL RATIO COMMENT	VJE 5 UNUSE UNUSE UNUSE UNUSE UNUSE	D D D D			
MOVJ VJ=50	.00				
Main Menu	Simp	le Menu			

- 2. Select the position level "UNUSED".
 - The selection dialog box appears.

JOB	EDIT	DISPLAY	UTILITY	12 🗹 📶 🆇 🔟 📑 👆
DETAIL EDI MOVJ	IT			
JOINT SPEE POS LEVEL NWAIT UNTIL ACCEL RATI DECEL RATI COMMENT	PL= FINE= UNUSE	D D		
[MOVJ VJ=	50.00			
Main Menu	JSimpl	le Menu		

- 3. Select "PL".
 - The position level is displayed. The position initial value is 1.

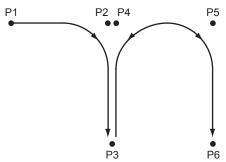

JOB	EDIT	DISPLAY	UTILITY) 12 🗷 📶 🥺	10 🕞 🙌

- 3 Teaching
- 3.2 Teaching Operation
- 4. Press [ENTER].
 - To change the position level, select the level in the input buffer line, type the value using [Numeric Key], and press [ENTER]. The position level's move instruction is registered.

JOB	EDIT	DISPLAY	UTILITY	12 🗹 🐋 🔯 🖵 👆
JOB CONTEN J:11 CONTROL G	ROUP: R1		S:00 T00L:	
0001 MOVJ 0002 END	VJ=50.00			
MOVJ VJ=	50.00 PL=0			
Main Men	JSimp	le Menu		

5. Press [ENTER].

For example, to perform the movement steps shown below, set as follows:

Steps P2, P4, and P5 are simple passing points, and do not require accurate positioning. Adding PL=1 to 8 to the move instructions of these steps moves the manipulator around the inner corners, thereby reducing the cycle time.

If complete positioning is necessary as P3 or P6, add PL=0.

<EXAMPLE>

Passing points P2, P4, and P5:

MOVL V=138 PL=3

Positioning point P3 and P6:

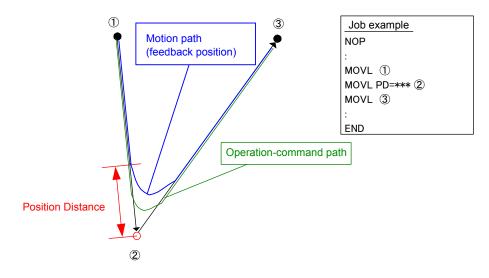

MOVL V=138 PL=0

3.2 Teaching Operation

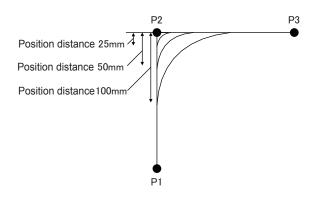

Position Distance (PD): The position distance can be added to the instruction MOVL (linear interpolation). When the position distance is specified, the manipulator (at the feedback position) starts inward-turning operation from the specified point.

By adding this tag, a specific distance can be used to adjust how close the manipulator moves to the taught position.

The relation among the position distance, the operation-command path, and the manipulator's motion path (feedback position) is shown in the following figure. The manipulator can perform inward-turning operation from the specified point.

The relation between the manipulator's path and the teaching position when the position distance is specified is shown below.

3.2 Teaching Operation

Setting the Position Distance

- 1. Select the MOVL instruction.
 - The DETAIL EDIT window appears.

JOB	EDIT	DISPLAY	UTILITY	12 🗹 🖬 😣	10 🗣 🙌

Main Men	u Simp	le Menu			

5. Press [ENTER].

If a large value is specified for the position distance in a short-distance step, the accuracy of the position distance may be deteriorated.

The manipulator starts its inward-turning operation in the latter half of the step's distance.

- 3 Teaching
- 3.2 Teaching Operation
- 3.2.3.2 Registering Reference Point Instructions

Reference point instructions (REFP) set an auxiliary point such as a wall point for weaving. Reference point Nos. 1 to 8 are assigned for each application. Follow these procedures to register reference point instructions.

- 1. Select {JOB} under {Main Menu}.
- 2. Select {JOB}.
- 3. Move the cursor.
 - Move the cursor to the line immediately before the position where the reference point to be registered.

4. Grip the Enable switch.

REFP 1

- The servo power is turned ON.
- 5. Press [Axis Key].
 - Move the manipulator to the position to be registered as the reference point.
- 6. Press [REFP] or select "REFP" from the inform list.
 - The reference point instruction is displayed in the input buffer line.

 Move the cursor to the reference point number, and press [SHIFT] + the cursor to change the reference point number; or

 Press [SELECT] when the cursor is on the reference point number. Then, the data input buffer line appears. Input the number and press [ENTER].

- 8. Press [INSERT].
 - The [INSERT] lamp lights.
 When registering before the END instruction, pressing [INSERT] is not needed.
- 9. Press [ENTER].
 - The REFP instruction is registered.

	0003 MOVJ VJ=50.00	
	0004 CALL JOB: TEST01	
Reference point	0005 REFP 1	
is registered.	0006 MOVJ VJ=80.00	

The programming pendant does not have the [REFP] for the application of spot welding, motor gun, and of material handling, assembling, and cutting.

- 3 Teaching
- 3.2 Teaching Operation

3.2.3.3 Registering Timer Instructions

The timer instruction stops the manipulator for a specified time. Follow these procedures to register timer instructions.

- 1. Select {JOB} under {Main Menu}.
- 2. Select {JOB}.
- 3. Move the cursor.
 - Move the cursor to one line before the position where the timer instruction is to be registered.

One line before -	→ 0003 MOVJ VJ=50.00 0004 MOVL V=138
where timer	0004 MOVL V=138
instruction is	
to be registered	

- 4. Press [TIMER].
 - The TIMER instruction is displayed on the input buffer line.

- 5. Change the timer value.
 - Move the cursor to the timer value and change it by pressing [SHIFT] + the cursor. The timer unit of adjustment is 0.01 seconds.

TIMER T=1.00	
Sec	

 If [Numeric Keys] are used for inputting the timer value, press [SELECT] when the cursor is on the timer value. The data input line appears. Input the value and press [ENTER].

- 6. Press [INSERT].
 - The [INSERT] lamp lights.
 - When registering before the END instruction, pressing [INSERT] is not needed.
- 7. Press [ENTER].
 - The TIMER instruction is registered.

0003 MOVJ VJ=50.00
0004 TIMER T=1003
0005 MOVL V=138

3.2 Teaching Operation

Changing Timer Value

- 1. Press [TIMER].
- 2. Press [SELECT].
 - The DETAIL EDIT window for the TIMER instruction appears.

JOB	EDIT DISPLAY	12 🗷 📶 😣	🙋 🖵 🙌
DETAIL EDIT TIMER			
TIME	∎ 1.00 🗑		
TIMER T=1.00)

- 3 Teaching
- 3.2 Teaching Operation
- 4. Press [ENTER].
 - The DETAIL EDIT window is closed and the JOB CONTENT window appears again. Modified content is displayed in the input buffer line.

5. Press [INSERT].

- The [INSERT] lamp lights.

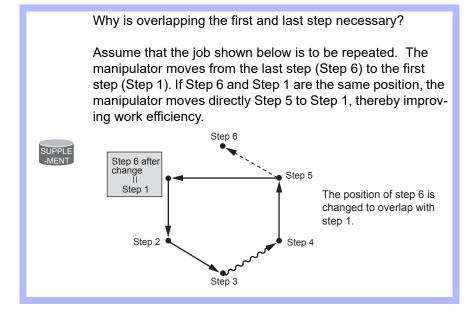

TIMER T=1003

- When registering before the END instruction, pressing [INSERT] is not needed.
- 6. Press [ENTER].
 - The TIMER instruction is registered.

- 3 Teaching
- 3.2 Teaching Operation

3.2.4 Overlapping the First and Last Steps

- 1. Move the cursor to the first step line.
- 2. Press [FWD].
 - The manipulator moves to the first step position.
- 3. Move the cursor to the last step line.
 - The cursor starts blinking.
 - When the cursor line position and the manipulator position are different in the JOB CONTENT window, the cursor blinks.
- 4. Press [MODIFY].
 - The key lamp lights.
- 5. Press [ENTER].
 - The position data for the first step is registered on the line of the last step.
 - At this time, only the position data can be changed in the last step. Interpolation type and play speed do not change.

- 3 Teaching
- 3.3 Checking Steps

3.3 Checking Steps

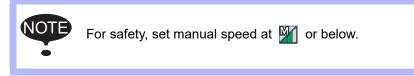

3.3.1 FWD/BWD Operations

Check whether the position of the taught steps is appropriate using [FWD] or [BWD] on the programming pendant. Each time [FWD] or [BWD] is pressed, the manipulator moves by a single step.

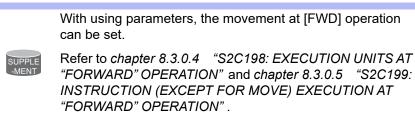

[FWD]: Moves the manipulator ahead in step number sequence. Only the move instruction is executed when [FWD] is pressed.

[INTERLOCK] + [FWD]: All instructions are executed alternately.

[BWD]: Moves the manipulator backward a step at a time in reverse step number sequence. Only the move instruction is executed.

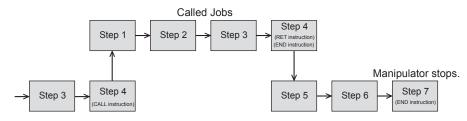

- 1. Move the cursor to the step to be checked.
- 2. Press [FWD] or [BWD].
 - The manipulator reaches the following / previous step and stops.

- 3 Teaching
- 3.3 Checking Steps
- 3.3.1.1 Precautions When Using FWD/BWD Operations

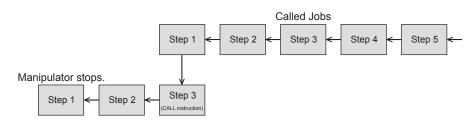

FWD Movements

- The manipulator moves in step number sequence. Only move instructions are executed when [FWD] is pressed. To execute all instructions, press [INTERLOCK] + [FWD].
 - The manipulator stops after playing a single cycle. It does not move after the END instruction is reached, even if [FWD] is pressed. However, at the end of a called job, the manipulator moves the instruction next to the CALL instruction.

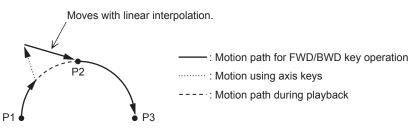

BWD Movements

- The manipulator moves in reverse step number sequence. Only move instructions are executed.
- The manipulator does not move after the first step is reached, even if [BWD] is pressed. However, at the beginning of a called job, the manipulator moves to the instruction immediately before the CALL instruction.

Circular Movements with [FWD/BWD] Operations

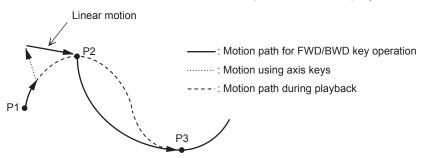

- The manipulator moves in a straight line to the first step of the circular interpolation.
- There must be three circular interpolation steps in a row to move the manipulator in an arc.
- If [FWD] or [BWD] operation is restarted after being stopped to move the cursor or to perform search, the manipulator moves in a straight line to the next step.
- If [FWD] or [BWD] operation is restarted after being stopped to move the axis as shown below, the manipulator moves in a straight line to P2, the next circular interpolation. Circular motion is restored from P2 to P3.

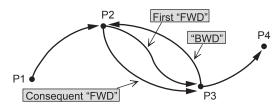

3.3 Checking Steps

Spline Curve Movements with FWD/BWD Operations

- The manipulator moves in a straight line to the first step of spline interpolation.
- There must be three spline curve motion steps in a row to perform a spline curve operation.
- Depending on the position where the [FWD] / [BWD] operation is performed, the alarm "IRREGULAR DISTANCES BETWEEN TEACHING POINTS" may occur.
- Note that FWD/BWD inching operations change the path of the manipulator and caution is therefore required. Performing these operations also increases the likelihood that the "IRREGULAR DIS-TANCES BETWEEN TEACHING POINTS" will occur.
- If the [FWD] or [BWD] operation is restarted after being stopped to move the cursor or perform a search, the manipulator moves in a straight line to the next step.
- If the [FWD] or [BWD] operation is restarted after being stopped to move the axis as shown below, the manipulator moves in a straight line to P2, the next spline curve motion step. Spline curve motion is restored from P2 onward. However, the path followed between P2 and P3 is somewhat different from the path followed at playback.

• If the manipulator is moved to P3 with [FWD], stopped, and then returned to P2 with [BWD], the path followed between P2 and P3 is different for each of the following: the first FWD operation, the BWD operation, and the consequent FWD operation.

- 3 Teaching
- 3.3 Checking Steps

3.3.1.2 Selecting Manual Speed

When [FWD] or [BWD] is pressed, the manipulator moves at the manual speed selected at that time. Selected manual speed can be checked by the manual speed indication on the programming pendant.

Manual speed is set with [FAST] and [SLOW]. FWD operation can be performed at a high speed by pressing [HIGH SPEED]. Follow these procedures to select a manual speed.

• Each time [FAST] is pressed, the speed switches in the order of "INCH"→"SLOW"→"MED"→"FAST".

• Each time [SLOW] is pressed, the speed switches in the order of "FAST"→"MED"→"SLOW"→"INCH".

- FWD/BWD operation is performed with SLW speed even if INCH is selected.
 - [HIGH SPEED] is available only for the FWD operation but not for BWD operation.

- 3 Teaching
- 3.3 Checking Steps

3.3.1.3 Moving to Reference Point

To check the position of a taught reference point, follow these procedures to move the manipulator to the reference point.

- 1. Move the cursor to the reference point instruction line to be checked.
- 2. Press [REFP] + [FWD].

- The manipulator moves to the reference point of the cursor line.

The programming pendant does not have the [REFP] for the application of spot welding, general purposes (= material handling, assembling, cutting) or motor gun.

3.3.1.4 Test Operations

Playback operations can be simulated in the teach mode with test operations. This function is convenient for checking continuous paths and operation instructions.

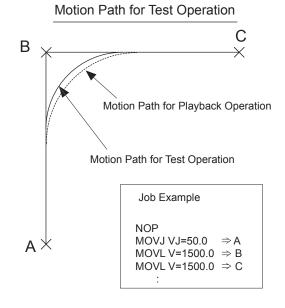

Test operation differs in the following ways from actual playback in the play mode.

• Operation speeds greater than the maximum teaching speed are reduced to the maximum teaching speed.

 Work instruction output, such as arc output, is not executed.

Note that the motion path for the playback operation is replayed during the test operation. Therefore, make sure that there is no obstacle around the manipulator and great caution should be exercised when the test operation is performed.

There may be a slight difference between the motion path for the test operation and the motion path for the playback operation due to a mechanical error or control delay, etc.

- 3 Teaching
- 3.3 Checking Steps

Test operation is performed by pressing [INTERLOCK] and [TEST START]. For safety purposes, these keys will only function while the keys are held down.

- 1. Select {JOB} under {Main Menu}.
- 2. Press {JOB}.
 - The test operation JOB CONTENT window appears.
- 3. Press [INTERLOCK] + [TEST START].
 - The manipulator starts the test cycle operation.
 - However, after the operation starts, the motion continues even if [INTERLOCK] is released.
 - The manipulator moves only while these keys are held down.
 - The manipulator stops immediately when [TEST START] is released.

Always check safety conditions before pressing [INTER-LOCK] + [TEST START] to start the manipulator in motion.

- 3 Teaching
- 3.3 Checking Steps

3.3.1.5 Machine Lock Operation

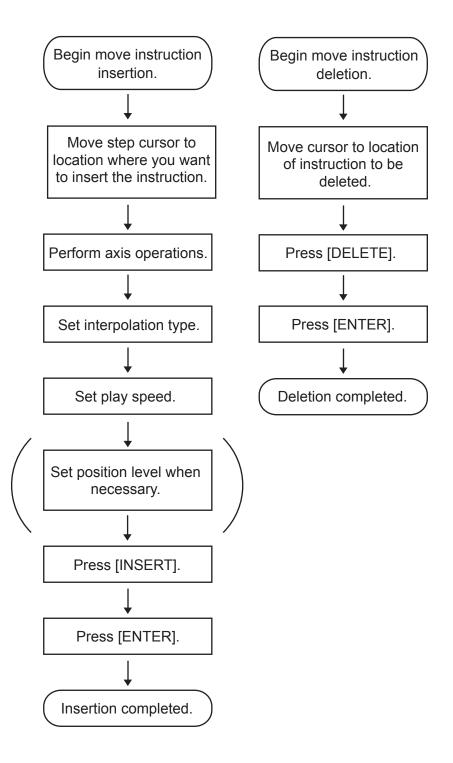

When "MACHINE LOCK" is enabled, the [FWD] / [BWD] operation or the test operation can be performed to check the status of input and output without moving the manipulator.

- 1. Press [AREA].
- 2. Select {UTILITY}.
- 3. Select {SETUP SPECIAL RUN}.
 - The SPECIAL TEACH window appears.
- 4. Select "MACHINE LOCK".
 - Press [SELECT] to switch "VALID" and "INVALID".

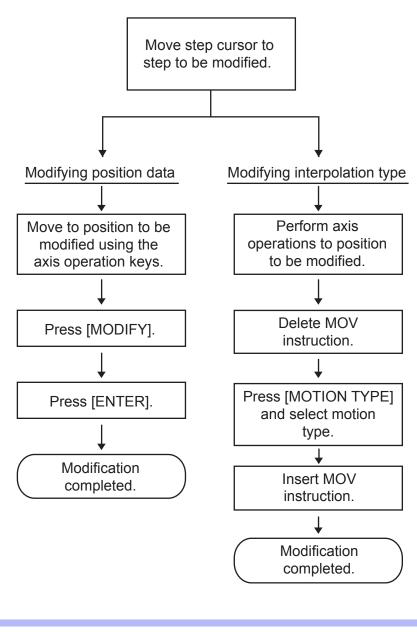

NOTE	 The setting of "MACHINE LOCK" is maintained even after the mode is switched: If the machine lock is set to "VALID" in the teach mode, it is still "VALID" after switching to the play mode. The same applies when the mode is switched from the play mode to the teach mode.
•	 Note that the machine lock becomes "INVALID" if the fol- lowing operation is performed.
	 Execution of "CANCEL ALL SELECT" in the SPECIAL PLAY window.
	Turning off the main power.

3. Select the job name to be called.

- 3 Teaching
- 3.4 Modifying Steps

3.4.2 Inserting Move Instructions

Step where move instruction is to be inserted

1. Move the cursor to the line immediately before the insert position.

The line immediately	0006	MOVL V=276
before where the	0007	TIMER T=1.00
move instruction	0008	DOUT OT#(1) ON
is to be added.	0009	MOVJ VJ=100.0

- 2. Press [Axis Key].
 - Turn ON the servo power and press [Axis Key] to move the manipulator to the position to be inserted.

Confirm the move instruction on the input buffer line and set desired interpolation type and play speed.

- 3. Press [INSERT].
 - The key lamp will light.

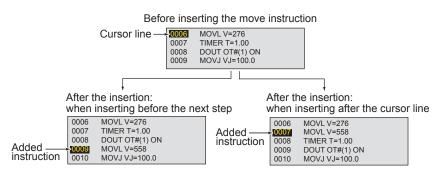

When the inserting position is immediately before the END instruction, pressing [INSERT] is not needed.

4. Press [ENTER].

- The move instruction is inserted after the cursor line.

	0006	MOVL V=276
	0007	TIMER T=1.00
	8000	DOUT OT#(1) ON
The move instruction	0009	MOVL V=558
is added.	0010	MOVJ VJ=100.0

- 3 Teaching
- 3.4 Modifying Steps
- 5. Press [ENTER].
 - <Examples of Inserting a Move Instruction>
 - When a move instruction is inserted in the following job, it is placed on different lines according to the setting in the TEACHING CONDI-TION window.

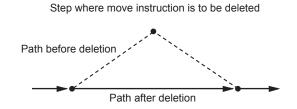

Positions where the move instructions are inserted.

The default location for insertions is "before the next step", but it is also possible to insert "after the cursor line". This setting is made in the "Move Instruction Register Method" in the TEACHING CONDITION window.

- 3 Teaching
- 3.4 Modifying Steps

3.4.3 Deleting Move Instructions

1. Move the cursor to the move instruction to be deleted.

If the manipulator position differs from the cursor position on the window, the cursor blinks. Stop the blinking by either of the following procedures.

- 1. Press [FWD] and move the manipulator to the position where the move instruction is to be deleted.
- Press [MODIFY] → [ENTER] to change the position data of the blinking cursor position to the current manipulator position.
- 2. Press [DELETE].
 - The key lamp will blink.
- 3. Press [ENTER].
 - The step indicated by cursor line is deleted.

- 3 Teaching
- 3.4 Modifying Steps

3.4.4 Modifying Move Instructions

- 3.4.4.1 Modifying Position Data
 - 1. Move the cursor to the MOV instruction to be modified.
 - Display the JOB CONTENT window and move the cursor to the move instruction to be changed.
 - 2. Press [Axis Key].
 - Turn ON the servo power and press [Axis Key] to move the manipulator to the desired position.
 - 3. Press [MODIFY].
 - The key lamp will blink.
 - 4. Press [ENTER].
 - The position data in the present position is registered.

3.4.4.2 Modifying Interpolation Type

Modifying only interpolation type is impossible. The interpolation type can be modified as a choice for modifying the position data.

- 1. Move the cursor to the move instruction to be modified.
 - Display the JOB CONTENT window, and move the cursor to the move instruction for which interpolation type is to be changed.
- 2. Press [FWD].
 - Turn ON the servo power and press [FWD] to move the manipulator to the position of the move instruction.
- 3. Press [DELETE].
 - The key lamp will blink.
- 4. Press [ENTER].
 - The cursor line step is deleted.
- 5. Press [MOTION TYPE].
 - Press [MOTION TYPE] to change the interpolation type.
 - Each time [MOTION TYPE] is pressed, the input buffer line instruction alternates.
- 6. Press [INSERT].
- 7. Press [ENTER].
 - The interpolation type and position data are changed at the same time.

- 3 Teaching
- 3.4 Modifying Steps

3.4.5 Undo Operation

After inserting, deleting, or modifying an instruction, the operation can be undone.

The UNDO operation becomes enabled by selecting {EDIT} \rightarrow {ENABLE UNDO}, and becomes disabled by selecting {EDIT} \rightarrow {*ENABLE UNDO} while editing a job.

• The undo operation can be performed even after the manipulator is moved by the FWD or BWD operation or test operation after inserting, deleting, or modifying a move instruction. However, the undo operation cannot be performed if other instructions are edited after editing the move instruction.

• The undo operation works only for the last five edited instructions only.

- 1. Press [SHIFT] + [CANCEL].
 - The assist menu appears.

- 2. Select {UNDO}.
 - The last operation is undone.
- 3. Select {REDO}.
 - The last UNDO operation is undone.

UNDO and REDO can be performed also by selecting the pull-down menu {EDIT} \rightarrow {UNDO}, and {EDIT} \rightarrow {REDO}.

- 3 Teaching
- 3.4 Modifying Steps

3.4.6 Modifying Reference Point Instructions

3.4.6.1 Deleting Reference Point Instructions

If the manipulator position differs from the cursor position, an error message is displayed. If this occurs, follow either of the procedures below.

- Press [REFP] + [FWD] to move the manipulator to the position to be deleted.
- Press [MODIFY] then [ENTER] to change the reference point position data to the current position of the manipulator.
- 1. Move the cursor to the reference point instruction to be deleted.
- 2. Press [DELETE].
 - The key lamp will blink.
- 3. Press [ENTER].
 - The reference point instruction at the cursor line is deleted.

3.4.6.2 Modifying Reference Point Instructions

- 1. Move the cursor to the reference point instruction to be modified.
- 2. Move the manipulator with [Axis Keys].
 - Turn ON the servo power and use [Axis Keys] to move the manipulator to the desired position.
- 3. Press [REFP].
- 4. Press [MODIFY].
 - The key lamp will light.
- 5. Press [ENTER].
 - The reference point instruction at the cursor line is changed.

- 3 Teaching

	Main Menu	Sim	ple Menu				

1. JOB NAME

Displays the name of the current job.

2. COMMENT

Displays the comments attached to the current job. This can be edited in this window.

3. JOB FOLDER

The JOB name which is set to this job is displayed.

This can be edited in this window.

4. DATE

Displays the date and time of the last editing of the job.

5. CAPACITY

Displays the amount of memory that is being used to register this job.

6. LINES

Displays the total number of instructions registered in this job.

7. STEPS

Displays the total number of move instructions registered in this job.

8. EDIT LOCK

Displays whether the Edit Lock setting for this job is "ON" or "OFF". When the security mode is set to the management mode or higher, this can be edited in this window.

9. TO SAVE TO FD

Displays "DONE" if the contents of the job have already been saved to an external memory after the date and time of the last editing operation, and displays "NOT DONE" if they have not been saved. The job is marked as "DONE" only if it is saved as an independent job or as a related job.

- 3 Teaching
- 3.5 Modifying Jobs

10. GROUP SET¹⁾

Displays the control group that this job controls. If the master axis is specified, the master axis is highlighted.

The "group set" can be changed if all of the following conditions are met.

- System software version YAS4.51.00A-00 or later.
- S2C1676=1 is set.
- Option function "control group expansion" is invalid.

11. JOB KIND¹⁾

Displays the kind of this job.

To return to the JOB CONTENT window from the JOB HEADER window, select {DISPLAY} from the menu and then select {JOB CONTENT}.

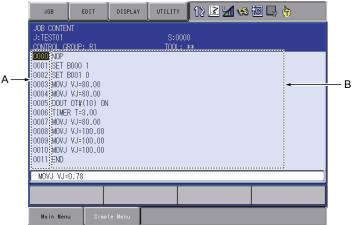

3.5.4 JOB CONTENT Window

- 1. Select {JOB} under {Main Menu}.
- 2. Select {JOB}.
 - The JOB CONTENT window appears.

 \leftarrow (Left) : The cursor is moved to the address area.

A. Address Area

Displays the line numbers, the step numbers and the tool numbers which are registered in the each step.

B. Instruction Area

Displays instructions, additional items, and comments. Line editing is possible.

¹ This item is displayed when a specific optional function is enabled.

3.5.5 COMMAND POSITION Window

- 1. Select {ROBOT} under {Main Menu}.
- 2. Select {COMMAND POSITION}.
 - Edit operations cannot be conducted on this window, but the taught play speed and position data can be viewed on this window.
 - Displays the distances between the command values and current values for the TCP.

Even if the command values are taught in pulses, the command values can be displayed in the Cartesian coordinates system.

A. INTR

Displays the interpolation method.

- **B. SPEED**
 - Displays the play speed.
- C. TEACH

Displays the teaching coordinates.

D. DISP.

Displays the display coordinates.

If the teaching coordinates are pulses, press the [SELECT] key to change to display coordinates.

* If the teaching coordinates are station, the display coordinates cannot be changed.

If tool is selected for the display coordinates, asterisks "*" are displayed for the command values and current values and only the distances are displayed.

E. Command Values

Displays the tool file number and position data that has been taught. Asterisks "*" are displayed for steps which have no motion data, such as move instructions which use position variables.

F. Current Values

Displays the current tool file number and position of the manipulator.

- 3 Teaching
- 3.5 Modifying Jobs

G. Difference

If the display coordinates are pulses, the differences for each axis are displayed as absolute values.

If the display coordinates are an option other than pulses, the distances between the command values and current values for the TCP are displayed as absolute values.

3.7.6 Commenting Out a Line

The lines in a job can be commented out by specifying line-by-line or multiple lines.

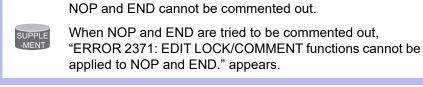

By commenting out a line, the line can be exempted from a target when executing a job.

When modifying or selecting the commented-out line, "ERROR 1012: This line is defined as a comment." appears.

When performing the conversion operation, such as the parallel shift job conversion, for a job that includes the commented-out line, the conversion operation cannot be performed to the commented-out line.

Followings are the settings for the commented-out line:

- Treated equivalent as a comment instruction.
- · Cannot be edited.
- Displayed as a line or a step.
- The set position can be confirmed by using direct open function.
- Exempted from a target for the conversion operation.

3.7.6.1 Commenting Out One Line

- 1. Display the {JOB CONTENT} window.
- 2. Move the cursor to the targeted line.
 - Place the cursor on the line to be commented out.
 - Move the cursor to the right (INST).

3.7.7 Prohibiting Editing Line-by-Line

The Edit Lock setting can be performed to the jobs line-by-line.

By setting the Edit Lock to a job line, the line will be prohibited from being edited.

When the editing operation, such as changing, deletion, selection, or cutting, is performed to the line to which the Edit Lock is set, "Error 1011: EDIT LOCK is set for this line." appears.

Also, when the conversion operation such as the parallel shift job conversion is performed to the job including the lines to which the Edit Lock is set, the lines will not be converted.

The Edit Lock cannot be set to NOP and END.

When Edit Lock is tried to be set to NOP and END, "ERROR 2371: EDIT LOCK/COMMENT functions cannot be applied to NOP and END." appears.

3.7.7.1 Prohibiting Editing One Line

For the Edit Lock operation of one line, follow the procedures below.

- 1. Display the {JOB CONTENT} window.
- 2. Move the cursor to the targeted line.
 - Place the cursor on the line to which the Edit Lock operation is to be performed.
 - Move the cursor to the right (INST).

Main Menu Sim	ple Menu			

- 3 Teaching
- 3.8 Test Operations

3.8 Test Operations

Playback operations can be simulated in the teach mode with test operations. This function is convenient for checking continuous paths and operation instructions.

Test operation differs in the following ways from actual playback in the play mode.

- Operation speeds greater than the maximum teaching speed are reduced to the maximum teaching speed.
- NOTE On for
 - Only machine lock is available among special operations for playback in the play mode.
 - Work instruction output, such as arc output, is not executed.

3.8.1 Test Operation Procedures

Test operation is performed by pressing [INTERLOCK] and [TEST START]. For safety purposes, these keys will only function while the keys are held down.

- 1. Select {JOB} under {Main Menu}.
- 2. Press {JOB}.
 - The test operation JOB CONTENT window appears.
- 3. Press [INTERLOCK] + [TEST START].
 - The manipulator starts the test cycle operation.
 - The manipulator moves only while these keys are held down.
 However, after the operation starts, the motion continues even if [INTERLOCK] is released.
 - The manipulator stops immediately when [TEST START] is released.

Always check safety conditions before starting the manipulator in motion.

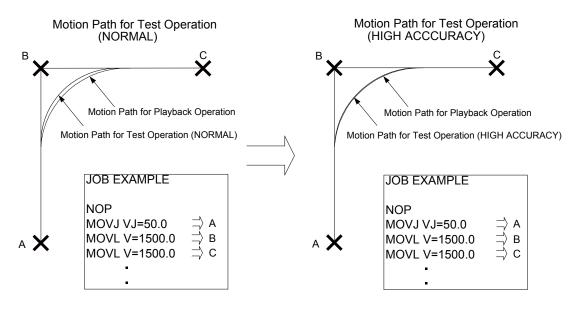

- 3 Teaching
- 3.8 Test Operations

3.8.2 Test Operation (High Accuracy)

3.8.2.1 Test Operation (High Accuracy)

In test operation (high accuracy), the motion path of the manipulator's control point for playback operation in the taught speed (speed override: 100%) is simulated by executing "test operation".

The repetitive accuracy of the motion path in test operation (high accuracy) had been greatly improved in comparison with the conventional test operation (normal).

For the "test operation", refer to *chapter 3.8.1 "Test Operation Procedures"*.

NOTICE

Following functions cannot be simulated in the test operation (high accuracy).

Weaving function

SUPPLE

- COMARC function
- Sensor function
- Twin/triple coordinated control function
- Conveyor synchronized function
- Weld line coordinate shift function

When the functions above are tried to be executed in test operation (high accuracy), the alarm "4909 TEST RUN(HIGH ACCURACY) ERROR" occurs. As for the functions above, operate in the test operation (normal).

3 Teaching

3.8 Test Operations

The switching position of the cursor is different in test operation (high accuracy) and in test operation (normal).

Before performing the job editing (add or modify teaching position) or back operation after the test operation (high accuracy) is interrupted, make sure to check the cursor position.

When operating in test operation (high accuracy), in order to perform control for reproducing the motion path of the robot control points during playback, manipulator motion may have more vibrations than previous test operation (normal) for certain teaching positions and teaching speeds.

If this happens, either use test operation (normal), or lower the motion speed in test operation.

For details on the procedure for setting test operation (normal), see *chapter 3.8.2.2 "Setting Method"*.

For the procedure for changing the motion speed for test operation, see *chapter 3.8.3 "Test Operation: Changing the Motion Speed"*.

3 Teaching

3.8 Test Operations

3.8.2.2 Setting Method

- 1. Select {SETUP} under main menu \rightarrow {TEACHING CONDITION SETTING}.
- 2. Move the cursor to the "TEST RUN CONTROL" and select "HIGH ACCURACY". ("NORMAL" and "HIGH ACCURACY" are displayed alternately.)

"HIGH ACCURACY" is for test operation (high accuracy) and "NORMAL" is for the conventional test operation.

DATA	EDIT	DISPLAY	UTILITY	12 🗷 🖬 🤜	8 🙋 🖵 🙌

Main Men	Main Menu Simple Menu						

By executing "test operation" after the setting above, test operation (high accuracy) is started.

When "HIGH ACCURACY" is selected for TEST RUN CONTROL

The motion path of the manipulator's control point for playback operation in the teaching speed (speed override: 100%) will be reproduced also in the following operation.

- Speed override: 1% to 99%

(For details of the speed override, refer to *chapter 4.4.1 "Speed Override"*.)

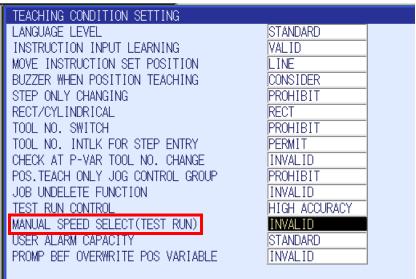

- 3 Teaching
- 3.8 Test Operations

3.8.3 Test Operation: Changing the Motion Speed

The motion speed for test operation can be changed to the manual speed levels of Low, Medium, and High.

- 1. Select {SETUP} \rightarrow {TEACHING CONDITION SETTING} to display the following window
- Move the cursor to the "MANUAL SPEED SELECT (TEST RUN)", and select "VALID"

("VALID" and "INVALID" are displayed alternately.).

 When MANUAL SPEED SELECT (TEST RUN) is set to "VALID", the Low, Medium, and High levels appear for "MANUAL SPEED (TEST RUN)".

TEACHING CONDITION SETTING	
LANGUAGE LEVEL	STANDARD
INSTRUCTION INPUT LEARNING	VALID
MOVE INSTRUCTION SET POSITION	LINE
BUZZER WHEN POSITION TEACHING	CONSIDER
STEP ONLY CHANGING	PROHIBIT
RECT/CYLINDRICAL	RECT
TOOL NO. SWITCH	PROHIBIT
TOOL NO. INTLK FOR STEP ENTRY	PERMIT
CHECK AT P-VAR TOOL NO. CHANGE	INVALID
POS.TEACH ONLY JOG CONTROL GROUP	PROHIBIT
JOB UNDELETE FUNCTION	INVALID
TEST RUN CONTROL	HIGH ACCURACY
MANUAL SPEED SELECT(TEST RUN)	VALID
MANUAL SPEED(TEST RUN):LOW	60 %
MANUAL SPEED(TEST RUN):MEDIUM	80 %
MANUAL SPEED(TEST RUN):HIGH	100 %

The motion speeds for the Low, Medium, and High test operation manual speeds can be specified individually for each speed level.

At 100%, the maximum teaching speed (speed when MANUAL SPEED SELECT (TEST RUN) is set to "INVALID") is used.

- 3 Teaching
- 3.9 Other Job-editing Functions

3.9 Other Job-editing Functions

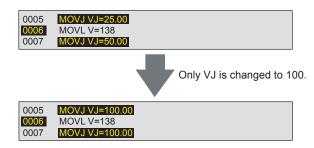

3.9.1 Editing Play Speed

There are two ways to modify play speed:

- Modification of Speed Type
- Relative Modification

3.9.1.1 Modification of Speed Type

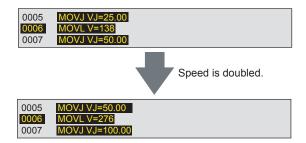

This method is used to modify the speed type (such as VJ, V, VR, etc.)

Type of Play Speed	Explanation	
VJ	Joint Speed	Normal robot axes
V	TCP Speed	
VR	Posture Angle Speed	
VE	Base Axis Speed	

3.9.1.2 Relative Modification

All steps are selected for the play speed VJ, V,VR, VE. This method is used to change all steps by a specified percentage (1% to 200%). This is called relative modification.

- 3 Teaching
- 3.9 Other Job-editing Functions

The speed of the entire job or specified section can be changed.

- 1. Select {JOB} under {Main Menu}.
- 2. Select {JOB}.
 - The JOB CONTENT window appears.
- 3. Move the cursor to the instruction area.
- 4. Press [SHIFT] + [SELECT] in the speed modify start line.
 - If the section is not specified, the speed of the entire job will be changed.
 - Move the cursor to the end line. The line numbers of the selected lines are highlighted.
- 5. Select {EDIT} under the menu.
- 6. Select {CHANGE SPEED}.
 - The SPEED MODIFICATION window appears.

7. Set desired items.

A. START LINE NO.

Displays the first line number of the section to be modified.

B. END LINE NO.

Displays the last line number of the section to be modified.

C. MODIFICATION TYPE

Selects the confirmation before changing: "CONFIRM" or "NO CON-FIRM".

Each time [SELECT] is pressed when the cursor is on this item, the setting alternates between "CONFIRM" and "NO CONFIRM".

D. SPEED KIND

Selects the speed type.

When [SELECT] is pressed when the cursor is on this item, the selection dialog box appears. Select the speed type to be changed. To perform the relative modification of the play speed, select "RELA-TIVE".

E. SPEED

Specifies the speed value.

When [SELECT] is pressed when the cursor is on this item, the mode changes to the number input mode. Input the speed value and press [ENTER].

- 3 Teaching
- 3.9 Other Job-editing Functions
- 8. Select "EXECUTE".
 - The speed begins to change.
 - If "MODIFICATION TYPE" is set to "CONFIRM", the confirmation dialog box "Modifying speed" is displayed. Press [ENTER] to change the speed on the first line and search for the next speed. Press the UP/DOWN cursor button to keep the speed on the first line and search for the next speed. To cancel the speed modification, press [CANCEL].
 - If "MODIFICATION TYPE" is set to "NOT CONFIRM", all the speeds of the specified section are changed.

3.9.1.3 Modification by TRT (Traverse Time)

Modifications made by TRT have the following characteristics:

- By setting the time required to execute a move instruction (moving time) to a desired value, the speeds can be modified.
- It is possible to measure the moving time without actually moving the manipulator.

For example, when the movement from lines 5 through 20 currently requires 34 seconds, and you want to reduce it to 15 seconds or extend it to 50 seconds, this function is used.

- 1. Select {JOB} under {Main Menu}.
- 2. Select {JOB}.
 - The JOB CONTENT window appears.
- 3. Move the cursor to the instruction area.
- 4. Press [SHIFT] + [SELECT] in the weaving time measure start line.
 - Move the cursor to the end line. The line numbers of the selected lines are highlighted.
- 5. Select {EDIT} under the menu.

- 3 Teaching
- 3.9 Other Job-editing Functions
- 6. Select {TRT}.
 - The TRT window appears.

	JOB	EDIT	DISPLAY	UTILITY	12 🗹 🖌 😣	10 🕞 🙌
A B C D	→ START LIN → END LINE → MOVING TI → SETTING 1	NO. IME	0000 0012 00000.00 s 00000.01 s			
	EXECUT	ΓE	CANCE	EL		
	Main Menu	Sin	ple Menu			

7. Set the desired items.

A. START LINE NO.

Displays the first line number of the section to be measured and modified.

B. END LINE NO.

Displays the last line number of the section to be measured and modified.

C. MOVING TIME

The weaving time needed to move from the first number to last number is measured and displayed.

D. SETTING TIME

Set the desired weaving time.

When [SELECT] is pressed when the cursor is on this item, the input buffer line appears. Input the desired weaving time and press [ENTER].

8. Select "EXECUTE".

- The speed is changed according to the setting.

	 If instructions that include specific speed data such as SPEED or ARCON instructions (including speed data of the welding condition file) exist in the specified section, the speed data for those steps are not changed. Also, the speed which is set to the play speed VMAX is not changed. Therefore, in such cases, the set time and the actual time required are not same. 						
NOTE	 If the speed data is limited by the maximum value, the following message is displayed. ILimited to maximum speed 						
	• The line to which the Edit Lock function is set or the com- ment out is performed cannot be changed. (For details, refer to <i>chapter 3.7.6 "Commenting Out a</i> <i>Line"</i> and <i>chapter 3.7.7 "Prohibiting Editing Line-by-</i> <i>Line"</i> .)						

- 3 Teaching
- 3.9 Other Job-editing Functions

3.9.2 Editing Interpolation Type

To modify the interpolation type of an already registered instruction, use the interpolation modification function.

- 1. Select {JOB} under {Main Menu}.
- 2. Select {JOB}.
 - The JOB CONTENT window appears.
- 3. Move the cursor to the instruction area.
- 4. Select the line to be modified.
 - The instruction on the cursor is displayed in the input buffer line.

JOB	EDIT	DISPLAY	UTILITY	12 🗹 📶 😣	🙋 🖵 🙌

- 5. Press [SHIFT] + the cursor simultaneously.
 - The interpolation type in the input buffer line changes.
 - The modification of the speed according to the modification of the interpolation type is calculated by the ratio to maximum speed at each speed.
 - Joint Speed: MAX=100.0%
 - Linear Speed: MAX=9000cm/min (e.g.)
 - Joint Speed: 50% = Linear Speed: 4500cm/min Linear Speed: 10% = Linear Speed: 900cm/min

0012 END			
MOVL V=9000			
Main Menu	Simple Menu		

- 3 Teaching
- 3.9 Other Job-editing Functions
- 6. Press [ENTER].
 - The instruction on the cursor line is replaced with one on the input buffer line.

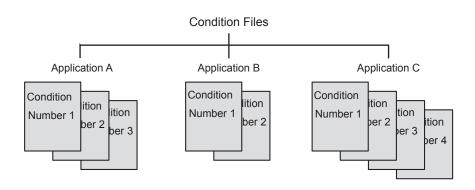

3.9.3 Editing Condition Files

Condition files are prepared in order to set the conditions for the manipulator to execute instructions.

Multiple condition files are provided for each application. More than one pattern can be set up in each condition file. The patterns are listed by "condition numbers". This number is specified by the work instruction in a job.

Regarding the contents and editing methods of the condition file, refer to YRC1000 Operator's Manual (subject specific) for each application.

3 Teaching

3.9 Other Job-editing Functions

3.9.4 User Variables

User variables are used to temporarily store counters, calculation results, or input signals in the job. The user variables can be freely defined in the job. Since the same user variables can be used in multiple jobs, save the numerical values as common references for the jobs. The user variables are maintained even when the power is turned OFF.

User variables have the following applications:

- · Controlling of the number of workpieces
- · Controlling of the number of jobs
- · Sending/receiving of information between jobs

The data formats for user variables are described in the following table.

Data Format	Variable No. (pcs.)	Functions
Byte type	B000 to B099 (100)	Range of storable values is from 0 to 255. Can store I/O status. Can perform logical operations (AND, OR, etc.)
Integer type	1000 to 1099 (100)	Range of storable values is from -32768 to 32767.
Double- precision integer type	D000 to D099 (100)	Range of storable values is from -2147483648 to 2147483647.
Real type	R000 to R099 (100)	Range of storable values is from -3.4E+38 to 3.4E38. Accuracy: 1.18E-38 < $x \le 3.4E38$
Character type	S000 to S099 (100)	Maximum storable number of characters is 16.
Boolean type (flag)	FL000 to FL1023 (1024)	Storable values are ON and OFF.
Position type	P000 to P127 (128)	Can store position data in pulse form or in XYZ form.
	BP000 to BP127 (128)	XYZ type variable can be used as target position data for move instructions, and as incremental values
	EX000 to EX127 (128)	for parallel shift instructions. Teaching line coordinates system cannot be used.
Timer variable	TM000 to TM059 (60)	Range of storable values is from -2147483648 to 2147483647.

Table 3-4: User Variables

* For the timer variable, refer to chapter 6.18.2 "Timer Variable".

- 3 Teaching
- 3.9 Other Job-editing Functions

	 Play Speed V: MOVL V=1000 The variable 1000 is used for speed V with this move instruction. <u>The unit for V is 0.1mm per second.</u> For example, if 1000 were set as 1000, the following would be true: 1000=1000→unit for V is 0.1mm/s→V=100.0mm/s Note that, depending on the unit being used, the value of the variable and the value of the actual speed on occasion might not match.
NOTE	 Play Speed VJ: MOVL VJ=1000 <u>The unit for VJ is 0.01%.</u> For example, if 1000 were set as 1000, the following would be true: 1000=1000→unit for VJ is 0.01%→VJ=10.00%.
	 Timer T: TIMER T=1000 <u>The unit for T is 0.01 seconds.</u> For example, if 1000 were set as 1000, the following would be true: 1000=1000→unit for T is 0.01 seconds→T=10.00 sec- onds.

- 3.9.4.1 Setting Byte, Integer, Double Precision Integer, and Real Type Variables
 - 1. Select {VARIABLE} under {Main Menu}.
 - {BYTE}, {INTEGER}, {DOUBLE}, and {REAL} are displayed for the sub menu.
 - 2. Select desired variable type.
 - The BYTE VARIABLE window appears. (Following is a case that $\{\text{BYTE}\}$ is selected.)

- (2) Check the selected axis on the status line.
- 3. Press [FWD].
 - Selected axis moves to the position specified by the variable.

The selected axis (manipulator, base, or station) moves directly to the set variable position. Before pressing [FWD], check that the surrounding area is

Before pressing [FWD], check that the surrounding area is safe.

- 3 Teaching
- 3.9 Other Job-editing Functions

3.9.4.11 Manipulator Types

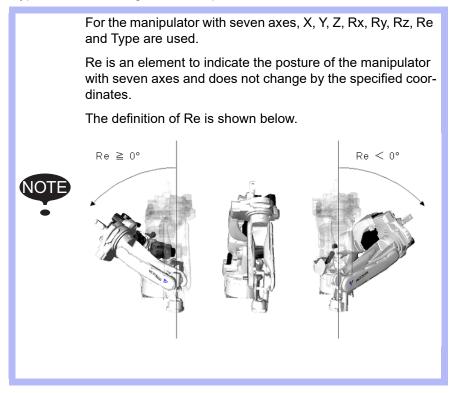

When the position data of the job data are described using the XYZ format, several postures may be taken according to the manipulator's structure when moving it to the described position.

Although these postures have the same coordinates for TCP, they vary in pulse for each axis.

Thus, the manipulator's posture cannot be uniquely defined only by the coordinate value, and it is necessary to specify the data other than the coordinate value to define the manipulator's posture.

This is called "Type".

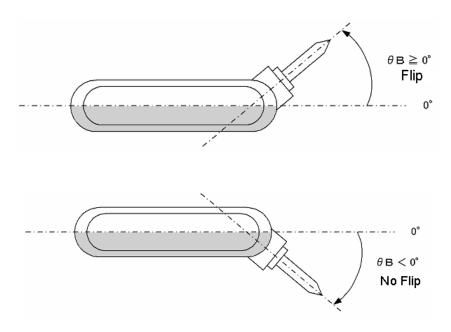

Type varies according to the manipulator model.

- 3 Teaching
- 3.9 Other Job-editing Functions

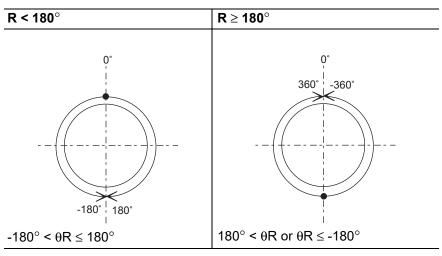

3.9.4.12 Flip/No Flip

When the angle of B-axis is within (+) range ($\theta B \ge 0^\circ$), it is called "Flip", and when within (-) range ($\theta B < 0^\circ$), "No Flip".

3.9.4.13 R-Axis Angle

This specifies whether the R-axis angle is less than $\pm 180^\circ$ or greater than $\pm 180^\circ.$

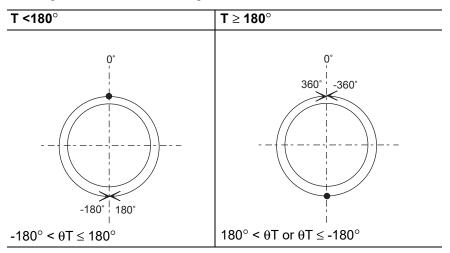

Note that θR is the angle when the R-axis home position is 0°.

- 3 Teaching
- 3.9 Other Job-editing Functions

3.9.4.14 T-Axis Angle

This specifies positions of the R-, B-, and T-axis.

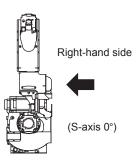

For manipulators with wrist axes (three axes), this specifies whether the T-axis angle is less than $\pm 180^{\circ}$ or greater than $\pm 180^{\circ}$.

Note that θT is the angle when the T-axis home position is 0°.

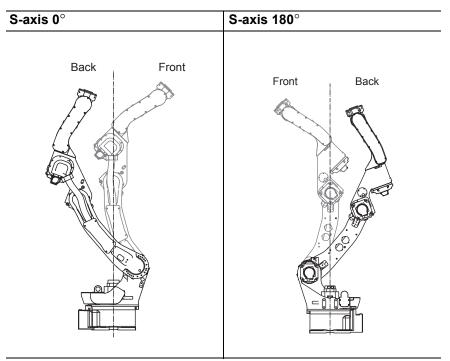

3.9.4.15 Front/Back

This specifies where in the S-axis rotation center the B-axis rotation center locates when viewing the L-axis and U-axis from the right-hand side. When viewed from the right-hand side, the right of the S-axis rotation center is called the front, and the left is called the back.

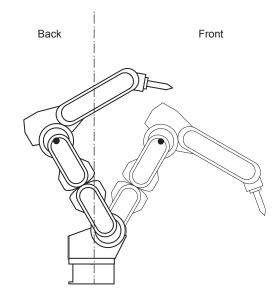

- 3 Teaching
- 3.9 Other Job-editing Functions

The diagram below shows the S-axis at 0° and at 180° . This is the configuration when the L-axis and the U-axis are viewed from the right-hand side.

For the manipulator with seven axes, this specifies where in the S-axis rotation center the U-axis rotation center locates when viewing the L-axis and U-axis from the right-hand side.

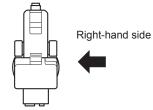

When viewed from the right-hand side, the right of the S-axis rotation center is called the front, and the left is called the back.

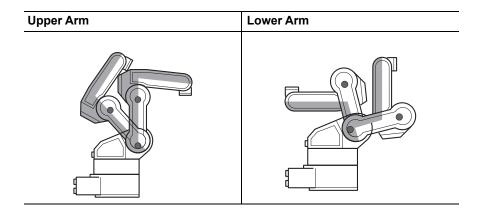

- 3 Teaching
- 3.9 Other Job-editing Functions

3.9.4.16 Upper Arm/Lower Arm

This specifies a type comprised of L-axis and U-axis when the L-axis and U-axis are viewed from the right-hand side.

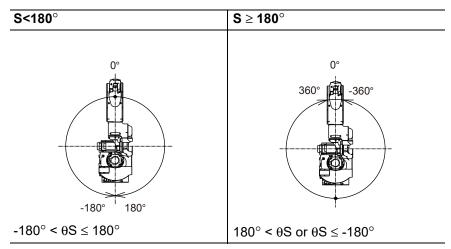

3.9.4.17 S-Axis Angle

This designation is required for the manipulators which have working envelopes greater than $\pm 180^\circ.$

This specifies whether the S-axis angle is less than $\pm 180^{\circ}$ or greater than $\pm 180^{\circ}$.

Note that θS is the angle when the S-axis home position is 0°.

- 3 Teaching
- 3.9 Other Job-editing Functions

3.9.5 Editing Local Variables

As well as user variables, local variables can be used for the storage of counters, calculations, and input signals. The data format is the same as that of user variables. As shown in the following table, the letter L is affixed to the variable number to indicate a local variable.

Table 3-6: Local Variables

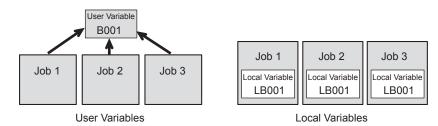

Data For	mat	Variable No.	Functions
Byte type		LB000 to LBDDD	Range of storable values is from 0 to 255. Can store I/O status. Can perform logical operations (AND, OR, etc.)
Integer ty	pe	LI000 to	Range of storable values is from -32768 to 32767.
Double-precision integer type		LD000 to	Range of storable values is from -2147483648 to 2147483647.
Real type		LR000 to LRDDD	Range of storable values is from -3.4E+38 to 3.4E+38 Accuracy: 1.18E-38 < x ≤ 3.4E+38
Character	type	LS000 to LSDDD	Maximum storable number of characters is 16.
Position type	Robot axes	LP000 to LPDDD	Can store position data in pulse form or in XYZ form. XYZ type variables
	Base axes	LBP000 to LBPDDD	can be used as target position data for move instructions, and as incremental values for parallel shift instructions.
	Station axes	LEX000 to	Teaching line coordinates system cannot be used.

Local variables differ from user variables in the following four ways:

• Used in One Job Only

With user variables it is possible to define and use one variable in multiple jobs, but local variables are used only in the job in which they are defined, and cannot be read from other jobs.

Accordingly, local variables do not affect other jobs, so it is possible to define a variable number (such as LB001) separately in different jobs, and use it in different ways in each of these jobs.

Able to Use Any Number of Variables

The number is set in the JOB HEADER window. When the number is set, the area for the value is saved in memory.

Not Able to Display the Variable Contents

To display the local variable contents, user variables are needed. For example, to view the contents of local variable LP000, save it temporarily as user variable P001. Then execute the instruction SET P001 LP000, and view the POSITION VARIABLE window for P001.

- 3 Teaching
- 3.9 Other Job-editing Functions

• Enabled Only During the Execution of the Defined Job

The contents of the local variables are enabled only during the execution of the defined job.

The local variable field is assured when the defined job is called (when the job is executed by a CALL or JUMP instruction, or the job is selected by the menu). Once the job is completed by the execution of a RET, END, or JUMP instruction, the local variable data that was set is disabled. However, if a job which uses local variables itself calls a separate job, then is returned by use of a RET instruction, the data that was present prior to the CALL instruction remains in effect and can be used.

Precautions for Variables and Units

As was the case with user variables, note that, depending on the value of the unit being used, the value of the variable and the value of the actual speed or time an occasion might not match. Refer to *chapter 3.9.4 "User Variables"*.

- 3 Teaching
- 3.9 Other Job-editing Functions
- 3.9.5.1 Setting the Number of Local Variables

The number of local variables used in a job is set in the JOB HEADER window. When the number of local variables is set, memory is allocated for those variables.

Only when expanding the "INSTRUCTION LEVEL", it is possible to use local variables. However, when "PROHIBIT" is set to {CONTENT DIS-PLAY}, the number of local variables cannot be confirmed or changed. Refer to chapter 8.12 "Instruction Level Setting" of "YRC1000 INSTRUCTIONS" (RE-CTO-A221) for details on setting the language level.

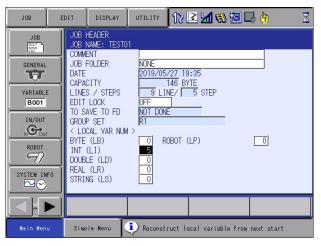

- 1. Select {JOB} under {Main Menu}.
- 2. Select {JOB}.
- 3. Select {DISPLAY} under the menu.
- 4. Select {JOB HEADER}.
 - The JOB HEADER window appears. Scroll the window using the cursor.

- 5. Select the number of local variables to be set.
 - The input buffer line appears.

- 4.1 Preparation for Playback

4.1.1.2 Registering the Master Job

If a particular job is played back frequently, it is convenient to register that job as a master job (master registration). A job registered as the master job can be called more easily than the method described on the preceding page.

Only one job can be registered as the master job. Registering a master job automatically cancels the previously registered master job.

Be sure to register a master job in the teach mode.

- 1. Select {JOB} under {Main Menu}.
- 2. Select {MASTER JOB}.
 - The MASTER JOB window appears.

4.1.2 The PLAYBACK Window

When the mode switch on the programming pendant is switched to "PLAY" while displaying the JOB CONTENT window, the PLAYBACK window appears.

A. Job Content

The cursor moves according to the playback operation. The contents are automatically scrolled as needed.

B. Speed Adjustment Settings

Displayed when the speed override is set.

C.Cycle Time

Displays the operating time of the manipulator. Each time the manipulator is started, the previous cycle time is reset, and a new measurement begins. Either showing or hiding the cycle time display is selectable.

D. Measure Start

First step in the measurement. Measurement starts when the lamp of [START] lights up and the playback starts.

E. Playback Time

Displays the time from the beginning to the end of the measurement. Measurement ends when the manipulator stops and the lamp of [START] turns off.

- 4 Playback
- 4.1 Preparation for Playback

4.1.2.1 Display of Cycle Time

Follow the procedure below to set whether or not to display the cycle time on the PLAYBACK window.

- 1. Select {DISPLAY} under the menu.
- 2. Select {CYCLE TIME}.
 - The cycle time is displayed.
 - Repeat the same operation to hide the cycle time display.

4.1.2.2 Operation Cycle

There are three types of manipulator operation cycles:

- AUTO : Repeats a job continuously.
- 1 CYCLE : Executes a job once. If there is a called job during execution, it is performed, after which the execution processing returns to the original job.
- 1 STEP : Executes one step (instruction) at a time.

The operation cycle can be changed as follows:

- 1. Select {JOB} under {Main Menu}, and then select {CYCLE}.
- 2. Select the operation cycle to be changed.
 - The operation cycle is changed.

- 4.2 Playback

4.2 Playback

4.2.1 Playback Operation

After checking to be sure there is no one near the manipulator, start the playback operation by following the procedures below.

Playback is the operation by which the taught job is played back. Follow the procedures below to start the playback operation.

Mode Switch on the programming pendant	Job is started up by
PLAY	[START] on the programming pendant
REMOTE	Peripheral device (external start input)

To perform playback by using the programming pendant, follow the procedures below.

4.2.1.1 Selecting the Start Device

- 1. Set the Mode Switch on the programming pendant to "PLAY".
 - The the play mode is enabled so that the job is started up by the programming pendant.

4.2.1.2 Servo On

- 1. Press [SERVO ON READY].
 - The YRC1000 servo power turns ON and the "SERVO ON" lamp on the programming pendant lights up.

4.2.1.3 Start Operation

- 1. Press [START].
 - The lamp of [START] lights up and the manipulator starts operation.

- 4 Playback
- 4.2 Playback

4.2.2 Special Playback Operations

The following special operations can be performed during playback:

- Low speed operation
- · Limited speed operation
- Dry-run speed operation
- Machine lock operation
- Check mode operation
- Weaving prohibited operation

Two or more special operations can be performed at the same time. If multiple operations are selected, the speed during playback is limited to the speed of the slowest operation. Settings for special operations are done in the SPECIAL PLAY window.

When the PLAYBACK window is displayed, move the cursor to the menu area and select {UTILITY} \rightarrow {SPECIAL PLAY}. The SPECIAL PLAY window appears.

DATA	EDIT	DISPLAY	UTILITY	12 🗳 📶 😣

		COMPLE	TE		
Main Men	u Sim	ple Menu			

4.2.2.1 Low Speed Operation

The manipulator moves at low speed during the first step after starting.

After the operation of this step, the manipulator stops regardless of the selection of the operation cycle and then low speed operation is canceled.

During/After one step operation, pressing [START] allows the manipulator to move at the taught speed from the next step.

- 1. Select "LOW SPEED START" on the SPECIAL PLAY window.
 - The setting alternates between "VALID" and "INVALID".
- 2. Select "COMPLETE".
 - The window returns to the PLAYBACK window.

- 4 Playback
- 4.2 Playback

4.2.2.2 Limited Speed Operation

The manipulator operates within the limited speed for the teach mode. Usually, the limited speed is set to 250 mm/s at the TCP and the flange. For the step in which the speed at the TCP is 250 mm/s or less, operation is performed at the taught playback speed.

- 1. Select "SPEED LIMIT" under the SPECIAL PLAY window.
 - The setting alternates between "VALID" and "INVALID".
- 2. Select "COMPLETE".
 - The window returns to the PLAYBACK window.

4.2.2.3 Dry-Run Speed Operation

The dry-run speed is a constant speed that is independent of the speed used for teaching, and the dry-run speed is usually 10% of the maximum speed. The manipulator executes all the steps at the constant speed, which is convenient for quick check of a job consisting of slow operations.

Be careful of steps programmed at lower speeds than the dry-run speed, because they are executed at greater speeds than programmed.

- 1. Select the "DRY-RUN SPEED" under the SPECIAL PLAY window.
 - The setting alternates between "VALID" and "INVALID".
- 2. Select "COMPLETE".
 - The window returns to the PLAYBACK window.

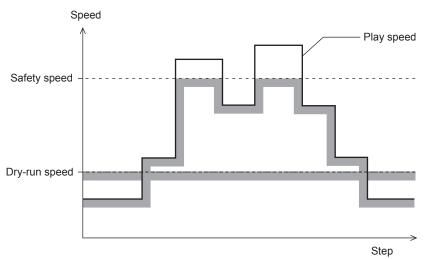

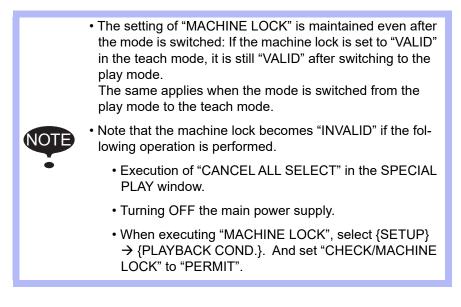

Fig. 4-1: Safety Speed and Dry-Run Speed

- 4 Playback
- 4.2 Playback

4.2.2.4 Machine Lock Operation

A job is played back without moving the manipulator to check the status of input and output.

- 1. Select "MACHINE LOCK" under the SPECIAL PLAY window.
 - The setting alternates between "VALID" and "INVALID".
- 2. Select "COMPLETE".
 - The window returns to the PLAYBACK window.

4.2.2.5 Check Mode Operation

The machine runs without issuing work instructions, such as the ARCON instruction. It is used primarily to check the path of the program.

- 1. Select "CHECK-RUN" under the SPECIAL PLAY window.
 - The setting alternates between "VALID" and "INVALID".
- 2. Select "COMPLETE".
 - The window returns to the PLAYBACK window.

When executing "CHECK-RUN", select {SETUP} \rightarrow {PLAY-BACK COND.}. And set "CHECK/MACHINE LOCK" to "PERMIT".

4.2.2.6 Weaving Prohibited Operation

The weaving operation is not executed in the weaving section of the job.

- 1. Select "WEAV PROHIBIT" under the SPECIAL PLAY window.
 - The setting alternates between "VALID" and "INVALID".
- 2. Select "COMPLETE".
 - The window returns to the PLAYBACK window.

- 4 Playback
- 4.2 Playback

4.2.2.7 Cancel All Special Operations

All special operations are disabled by the following operation:

- 1. Select {EDIT} from the menu.
- 2. Select "CANCEL ALL SELECT".
 - The message "All special functions canceled" appears.

Special operations are also automatically canceled if the main power supply is shut OFF.

- 4 Playback
- 4.3 Stop and Restart

4.3 Stop and Restart

The manipulator or JOB in operations stops in the following conditions:

- Hold
- Emergency stop
- Stop by alarm
- · Stop by other causes

4.3.1 Hold

By the hold operation, the JOB stops temporarily.

During the hold operation, the lamp on [START] turns OFF.

4.3.1.1 Using the Programming Pendant

- Hold
 - 1. Press [HOLD] on the programming pendant.
 - 2. The manipulator stops temporarily. The lamp on [HOLD] lights up while [HOLD] is held down.

4.3.1.2 Using an External Input Signal (System Input)

- Hold
 - 1. Turn ON the hold signal from an external input (system input).
 - The manipulator stops temporarily.

External holding

- The output signal "HOLD" turns ON.
- The programming pendant [HOLD] lamp lights up.
- Release
 - 1. Turn off the hold signal from an external input (system input).
 - Hold is released.
 - To restart the operation, press [START] or turn ON the external input signal (system input). The manipulator restarts its operation from the position where it was stopped.

- 4 Playback
- 4.3 Stop and Restart

4.3.2 Emergency Stop

At an emergency stop, the servo power supply that drives the manipulator is turned OFF and the manipulator stops immediately. An emergency stop can be performed by using either of the following:

- Button on the Front Door of the YRC1000
- Programming pendant
- External input signal (system input)

Emergency Stop

- 1. Press the emergency stop button 🌔
 - The servo power turns OFF and the manipulator stops immediately.
 - On the front door of the YRC1000:

- On the programming pendant:

Using the Emergency Stop Button on the Programming Pendant

Robot stops by P.P. emergency stop

Using the External Input Signal (System Input)

Robot stops by external emergency stop

Release

1. Turn the emergency stop button (in the direction of the arrows.

URN

TURN

– On the front door of the YRC1000:

- On the programming pendant:
- To turn ON the servo power supply again, press [SERVO ON READY] and then grip the Enable Switch of the programming pendant.

- 4 Playback
- 4.3 Stop and Restart

4.3.2.1 Restart After Emergency Stop

- Prior to restarting the manipulator's operation after an emergency stop, confirm the position of the manipulator by using FWD, etc., and make sure that there is no interference between the manipulator and the workpiece or fixture.
- When an emergency stop is performed during a high-speed operation of consecutive steps, the manipulator may stop two or three steps before the displayed step. If the manipulator's operation is restarted under such conditions, the manipulator may interfere with the workpiece or fixture.

4.3.3 Stop by Alarm

If an alarm occurs during operation, the manipulator stops immediately and the ALARM window appears on the programming pendant indicating that the machine was stopped by an alarm.

 If more than one alarm occurs simultaneously, all alarms can be viewed on the window. Scroll down the viewing area of the window when necessary.

				RESET	
Main Men	u Simp	le Menu			

The following operations are available in the alarm status:

window change, mode change, alarm reset, and emergency stop. To display the ALARM window again when the window is changed during alarm occurrence, select {SYSTEM INFO} and then {ALARM HISTORY} under {Main Menu}.

- 4 Playback
- 4.3 Stop and Restart

Releasing Alarms

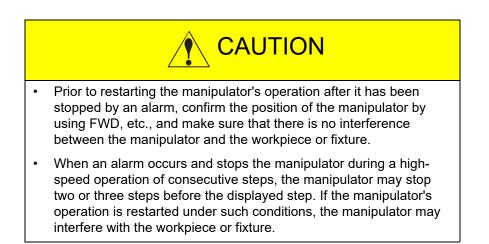

<Minor Alarms>

- 1. Press [SELECT].
 - Select "RESET" under the ALARM window to release the alarm status.
 - When using an external input signal (system input), turn ON the "ALARM RESET" setting.

<Major Alarms>

- 1. Turn OFF the main power supply and remove the cause of the alarm.
 - If a severe alarm such as hardware failure alarm occurs, the servo power is automatically shut off and the manipulator stops. If releasing does not work, turn OFF the main power and correct the cause of the alarm.

4.3.3.1 Restart After Stop by Alarm

- 4 Playback
- 4.3 Stop and Restart

4.3.4 Others

4.3.4.1 Temporary Stop by Mode Change

When the play mode is switched to the teach mode during playback, the manipulator stops immediately.

To restart the operation, return to the play mode and perform a start operation.

4.3.4.2 Temporary Stop by the PAUSE Instruction

When the PAUSE instruction is executed, the manipulator stops operating.

To restart the operation, perform a start operation. The manipulator restarts from the next instruction.

- 4 Playback
- 4.4 Modifying Play Speed

4.4 Modifying Play Speed

4.4.1 Speed Override

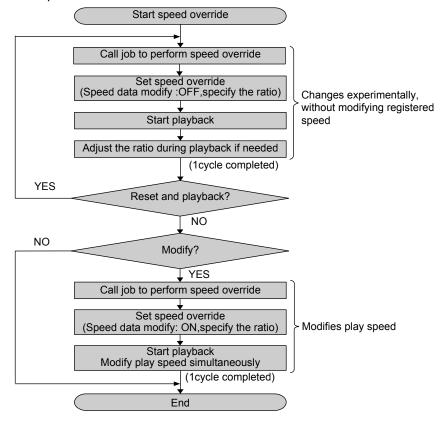

Speed modifications using the speed override have the following features:

- Speed can be modified during playback. The job can be played back at various speeds until the play speed is properly adjusted.
- Speed can be increased or decreased by a ratio of the current play speed.

The ratio settings range from 10% to 150% in increments of 1%. Therefore, it is convenient when, for example, all play speed settings are to be increased by 150% at the same time.

The motion path of the manipulator's control point for playback operation in the teaching speed (speed override: 100%) can also be operated and reproduced at a speed override less than 100%.

To enable the control described above, select {SETUP} \rightarrow {TEACHING CONDITION SETTING}, and then set "TEST RUN CONTROL" to "HIGH ACCURACY". (For details, refer to *chapter 3.8.2.2* "Setting Method".)

The operation flow is shown below.

- 4 Playback
- 4.4 Modifying Play Speed

4.4.1.1 Setting Speed Overrides

- 1. Select {UTILITY} under the menu in the PLAYBACK window.
- 2. Select {SPEED OVERRIDE}.
 - The PLAYBACK window shows the speed override status.

JO-

4.4 Modifying Play Speed

4.4.1.2 Modifying Play Speed

- 1. Set speed override.
- 2. Playback the manipulator.
 - The play speed is increased or decreased in the set ratio.
 - When setting "MODIFY" to "ON", the step's play speed is modified when each step is reached.
 - When one cycle is completed by the END instruction, the speed override setting is canceled.
 - Assuming that the manipulator moves from step 1 to step 2, the play speed of step 2 is not modified if the speed override is canceled before reaching step 2.
 - The play speed after the modification by the speed override is limited by the maximum and the minimum speed of manipulator.
 - When the safety speed operation is commanded with the setting of "MODIFY: ON", the manipulator operates at the safety speed. However, the play speed in memory is modified as set by the speed override.
 - Play speed set by the SPEED instruction is not modified.

4.4.1.3 Canceling Speed Override Settings

- 1. Select {UTILITY} under the menu in the PLAYBACK window.
- 2. Select {SPEED OVERRIDE}.
 - The setting of the speed override ratio is canceled.
 - If canceled, the speed ratio setting is not displayed on the PLAYBACK window.

The speed override settings are automatically canceled in the following cases:

• When dry-run speed operation is set.

- When the mode is changed to any mode other than the play mode.
- When an alarm occurs.
- When one cycle operation is completed with the END instruction.
- When the power supply is turned OFF.

- 4 Playback
- 4.4 Modifying Play Speed

4.4.2 Specification for Speed Override in AUTO Cycle Operation

4.4.2.1 Functional Overview

This specification allows the manipulator to temporarily change its operation speed during playback.

The operation speed is specified by setting the Speed Override percentage (1 to 100% in increments of 1%) for the operation speed (play speed) specified in the current job.

This function also enables an automatic setting of the Speed Override function when changing modes from TEACH to PLAY.

Speed Override function can be performed with this specification by setting the parameter S2C701.

4.4.2.2 Setting the Speed Override Function

1. Select {JOB} under {Main Menu}, and press {JOB}.

 - Setting the Dry-Run Speed mode.
 - Changing the mode to any mode other than PLAY.
 - Alarm or error occurs.
 - Power is turned OFF.
- 4.4.2.6 Enabling an Automatic Setting of Speed Override

This function allows Speed Override to be automatically set when the operation mode is changed from TEACH to PLAY. The percentage corresponds to the manual speed selected during the TEACH mode.

Manual Speed	Applicable Percentage
Inching	Maximum jog operation link speed x S1CxG045
Low	Maximum jog operation link speed x S1CxG045
Medium	Maximum jog operation link speed x S1CxG046
High	Maximum jog operation link speed x S1CxG047

4.4.2.7 Manual Speed in the TEACH Mode

The function is enabled by setting the parameter S2C699.

The manual speed (inching, low, medium, and high) in the TEACH mode is changed by using [MANUAL SPEED] on the programming pendant.

The manual speed is automatically set at LOW when:

- Changing modes from PLAY to TEACH.
- Changing coordinate system in the TEACH mode.
- Turning OFF the SERVO power in the TEACH mode.

4

Playback Modifying Play Speed 4.4

4.4.2.8 Parameter

4.4.3 Specification for Speed Override with Input Signals

4.4.3.1 Functional Overview

This specification allows the manipulator to temporarily change its operation speed during playback using the external input signals. The operation speed is specified by setting the speed override percentage (1 to 255% in increments of 1%) for the operation speed (play speed) specified in the current job.

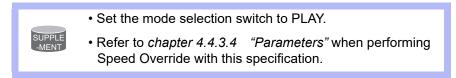

Fig. 4-2: Play Speed and Override Speed

- The play speed data of the job will not be modified.
- The maximum and minimum manipulator speeds limit the play speed modified by speed override.

- 4 Playback
- 4.4 Modifying Play Speed
- 4.4.3.2 Performing the Speed Override Function

- 1. Playback a job.
- 2. Input the external signals for Speed Override.
 - The message "Over-riding speed" and the Speed Override percentage appears on the screen.

4 Playback

4.4 Modifying Play Speed

4.4.3.4 Parameters

Parameter	Description	Details	Setting Value
S2C701	Speed Override setting	Specifies the usage of Speed Override. *To enable Speed Override with external signals, set "1" for the setting value. 0: Disables the Continuous Cycle operation; Enables speed modification (standard spec). 1: Enables the Continuous Cycle operation; Disables speed modification.	1
S4C287	Universal Input Group number setting (signals 1 to 8)	Specifies the signals to be used. Eight Universal Input points correspond to the signals 1 to 8 of S4C288 to S4C295.	1 to 512
S4C288	Speed percentage (%) Signal 1	Specifies the speed percentage by the Universal	0 to 255
S4C289	Speed percentage (%) Signal 2	Input signals set in S4C287. Priority: Signal 1 > Signal 8	
S4C290	Speed percentage (%) Signal 3	Filolity. Signal 1 > Signal 6	
S4C291	Speed percentage (%) Signal 4	If S4C288 to S4C295 are all "0", the input status	
S4C292	Speed percentage (%) Signal 5	1 to 255 of the Universal Input signals (8 points) will be applied to the speed percentage.	
S4C293	Speed percentage (%) Signal 6	will be applied to the speed percentage.	
S4C294	Speed percentage (%) Signal 7		
S4C295	Speed percentage (%) Signal 8		

The Override Speed percentage can be specified with the parameters (S4C288 to S4C295) in two ways as follows:

Setting a Speed Percentage with Respect to Each Signal

- Specify the speed percentage 1 to 255 in the parameters (S4C288 to S4C295). As to the speed percentage for unused signals, set "0": Speed Override will not take effect even when the external signals are input.
- The signal priority is: "Signal 1 > Signal 8". For example, when the signals 1 to 3 are input simultaneously, Speed Override will be performed applying the speed percentage of signal 1.

Using Eight Points of External Signals as the Speed Percentage Data

- Set "0" for all the parameters (S4C288 to S4C295).
- Speed Override will be performed applying the input status of signals 1 to 255 as the speed percentage.
 For example, when the signals 5 and 7 are input simultaneously, Speed Override will be performed applying 80% of the speed percentage.

When this function is enabled, Speed Override cannot be operated with a programming pendant.

- 4 Playback
- 4.4 Modifying Play Speed

4.4.4 Speed Override Setting Screen

The current settings can be confirmed and changed in the SPEED OVERRIDE SETTING window.

This function can be used starting from YAS4.00-00.

- 1. Select {SETUP} under {Main Menu}.
- 2. Select {SPEED OVERRIDE SETTING}.

- The SPEED OVERRIDE SETTING window appears.

Settings can be changed only when in teach mode and security is in management mode or higher.

In the speed override setting window, the target items that can be confirmed and changed vary depending on the setting method for speed override.

When {SETTING METHOD} is set to {PLAYBACK}, operation is performed as described in *chapter 4.4.1 "Speed Override"* and *chapter 4.4.2 "Specification for Speed Override in AUTO Cycle Operation"*.

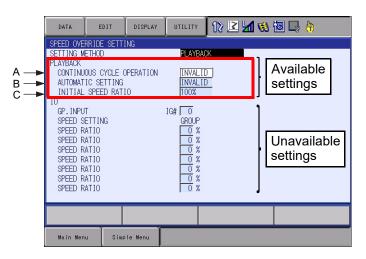

When set to {I/O}, operation is performed as described in chapter 4.4.3 "Specification for Speed Override with Input Signals".

Setting	Parameter value			
	S2C701	S4C287		
Playback	No change	0		
I/O	1	1		

Also, the parameters are set as shown in the following table.

- 4 Playback
- 4.4 Modifying Play Speed

When using SETTING METHOD: PLAYBACK

A. Continuous Cycle Operation

Specify how the speed override will be used.

When set to "INVALID", operation is performed as described in *chapter 4.4.1 "Speed Override"*.

When set to "VALID", operation is performed as described in *chapter 4.4.2 "Specification for Speed Override in AUTO Cycle Operation*".

Setting	Parameter value
	S2C701
INVALID	0
VALID	1

B. Automatic Setting

When set to "VALID", the speed override is set automatically when changing the mode from TEACH to PLAY. Also, {INITIAL SPEED

RATIO}(shown as C) is set to "HOLD".

Setting		
	S2C702	S2C709
INVALID	0	0
VALID	0	1

C. Initial Speed Ratio

The initial speed ratio can be set when the override function is set. When set to "HOLD", the ratio that was set previously is used. If the power is turned off, the initial speed ratio is reset to 100%.

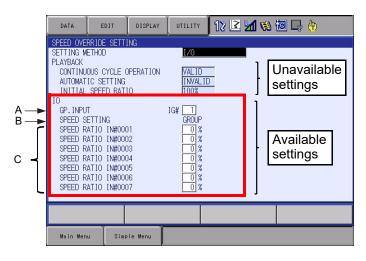

For details on manual speed, see *chapter 4.4.2.6 "Enabling an Auto-matic Setting of Speed Override"*.

When continuous cycle operation is set to "INVALID", the ratio is always 100%.

Setting	Parameter value			
	S2C702	S2C709		
HOLD	0	1		
MANUAL SPEED	1	0		

- 4 Playback
- 4.4 Modifying Play Speed

When using SETTING METHOD: I/O

A. GP. Input

Set the signal group that will be used.

For details, see <i>chapter 4.4.3.4</i>	"Parameters" .
Parameter	Setting value
S4C287	1 to 512

When the setting method is changed from {PLAYBACK} to {I/O}, the specified input group number is changed to "1". When it is changed from I/O to {PLAYBACK}, the number is changed to "0".

B. Speed Setting

This shows how to set the override speed ratio using I/O. The speed selection method based on the setting for {SPEED RATIO}(shown as C) is displayed.

{BIT}: Used by setting the speed ratio for each signal

{GROUP}: Used by setting the speed ratio data for 8 signals

For details, see chapter 4.4.3.4 "Parameters".

C. Speed Ratio

Set the speed ratio for each input signal that will be used.

For details, see chapter 4.4.3.4 "Parameters".

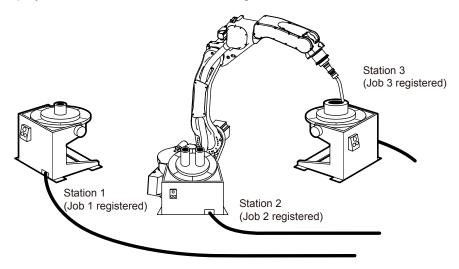

Parameter	Setting value
S4C288 to 295	0 to 255

- 4 Playback
- 4.5 Playback with Reserved Start

4.5 Playback with Reserved Start

4.5.1 Preparation for Reserved Start

In the reserved start function, jobs registered at different stations are played back in the reserved order using the start buttons on the stations.

For example, in the case where three stations handle three different workpieces, as shown in the illustration above, the jobs would be registered as follows:

- Job 1 is registered to process workpiece 1 at Station 1
- Job 2 is registered to process workpiece 2 at Station 2
- Job 3 is registered to process workpiece 3 at Station 3

To play back the jobs, prepare workpiece 1 and press the start button on Station 1. The manipulator executes Job 1. Prepare workpieces 2 and 3 while Job 1 is being executed, and press the start buttons on Stations 2 and 3. Even if Job 1 is being executed at that time, jobs on different stations are reserved in the order that the start buttons have been pressed, and will be executed in that order.

During playback, the status of the reservation can be checked on the start reservation window.

- 4 Playback
- 4.5 Playback with Reserved Start

4.5.1.1 Enabling Reserved Start

The start button on the station is operative when the reserved start function is enabled, and the following start operations are disabled.

- [START] on the programming pendant
- Start operation from external input signal (system input)

The FUNCTION ENABLE SETTING window is shown only when the security mode is set to the management mode.

- 1. Select {SETUP} under {Main Menu}.
- 2. Select {OPERATE COND}.
 - The OPERATING CONDITION window appears.
 - The screen is scrolled up/down by the cursor when it locates at the top/bottom of the items.

4.5.2 Playback from Reserved Start

- While the job is being executed, the start button lamp on the station lamps.
- If the workpiece must be prepared at the station, prepare it before pressing the start button.
- During the execution of a job for one station, if the start button of another station is pressed, the job of the latter station is reserved and prepared to start. Jobs are reserved and executed in the order that the start buttons have been pressed.

- When a job is reserved, the start button lamp on the station blinks.
- No station job is reserved when it is being executed even if its start button is pressed.
- To suspend a job being executed, perform the Hold operation.

4.5.2.1 Start Operation

- 1. Set the Mode Switch of the programming pendant to "PLAY".
 - The play mode is set.
- 2. Press start button on the station.
 - The job registered for the station starts up and the manipulator performs one cycle operation.

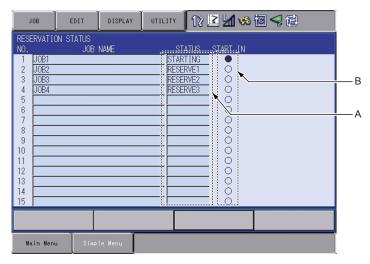

Reservations are canceled when the start button is pressed again during the job reservation operation.

- 4 Playback
- 4.5 Playback with Reserved Start

4.5.2.2 Checking Job Reservation Status

The job reservation status during playback can be checked.

- 1. Select {JOB} under {Main Menu}.
- 2. Select {RES. STATUS}.
 - The RESERVATION STATUS window appears.

A. STATUS

Reservation status is displayed.

STARTING: Indicates the station currently working.

STOP: Indicates any station where work has been temporarily stopped by a hold operation.

RESERVE1, RESERVE2,...: Indicates the order in which jobs have been reserved for start.

B. START IN

Input signal status is displayed.

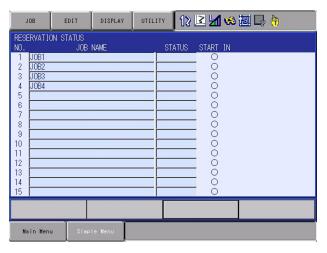

- "●": Input signal ON
- "O": Input signal OFF

- 4 Playback
- 4.5 Playback with Reserved Start

4.5.2.3 Resetting Job Reservation

- 1. Select {JOB} on the RESERVATION STATUS window.
- 2. Select {RESET RESERVATION} or {RESET ALL}.
 - When {RESET RESERVATION} is selected, job reservation stated to "RESERVE" is reset.
 - When {RESET ALL} is selected, job reservation stated to "STOP" and "RESERVE" is reset.

- The confirmation dialog box appears.

3. Select "YES".

All job reservations are reset automatically in the following conditions:

• When the reserved start sets to "PROHIBIT". (When "RESERVED START" is set to "PROHIBIT" on the FUNC-TION ENABLE SETTING window.)

• When another job is called or an edit operation is performed.

- 4 Playback
- 4.5 Playback with Reserved Start

4.5.3 Hold Operation

Hold operation causes the manipulator to stop all motion. It can be performed by the following buttons or signal.

- [HOLD] on the programming pendant
- External Input Signal (system input)
- · Hold button for the station axis

During the hold operation, the lamp on [START] turns OFF.

4.5.3.1 [HOLD] on the Programming Pendant

Hold

- 1. Press [HOLD] on the programming pendant.
 - The manipulator stops temporarily.
 - The [HOLD] lamp lights while the [HOLD] button is held down.

Release

- 1. Press the start button on the suspended station.
 - The manipulator restarts its operation from the position where it was stopped.

4.5.3.2 Hold by External Input Signal (System Input)

Hold

- 1. Input ON signal to the external input (system input) specified for the hold operation.
 - The manipulator stops temporarily.

External holding

- The hold lamp for the external output signal lights.
- The [HOLD] lamp on the programming pendant lights and the [START] lamp turns OFF.

Release

1. Input OFF signal to the external input (system input) specified for the hold operation.

Hold is released.

- 2. To continue the operation, press the start button on the suspended station.
 - The manipulator restarts its operation from the position where it was stopped.

- 4 Playback
- 4.5 Playback with Reserved Start

4.5.3.3 Hold at the Station

Hold

- 1. Press the hold button on the station.
 - The manipulator stops temporarily.

External holding

Release

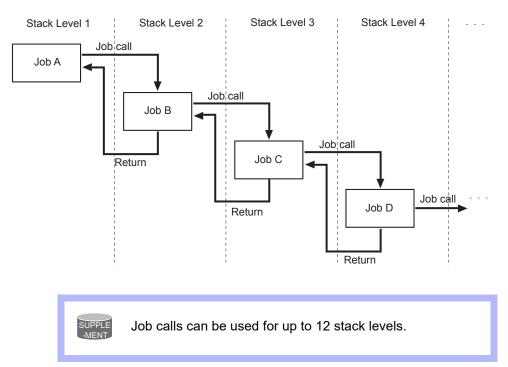

- 1. Press the hold button on the suspended station.
 - Hold is released.
 - Press the start button on the station, then the manipulator restarts its operation from the position where it was stopped.

Pressing the start button on a station that is not in the Hold status does not start manipulator operation. The job registered for the station is reserved or the reservation, if it has been made, is canceled.

- 4 Playback
- 4.6 Displaying Job Stack

4.6 Displaying Job Stack

During the execution of the series of jobs that combined with CALL or JUMP instructions, the job stack can be displayed to check where the current job is and how many jobs are left.

1. Select {DISPLAY} under the menu on the PLAYBACK window.

 For above example, the playback of "Job C" is being executed and "Job C" is called from "Job B". Also, "Job B" is called from "Job A".

	If any of the following operations are performed, the job stack is canceled.
	Creating a new job
	Calling the master job
	Selecting jobs
	 Copying and renaming jobs
SUPPLE -MENT	 Job conversion (relative job conversion, parallel shift job conversion, mirror shift job conversion)
	 Editing the job header window (change of axis operation control group, change the coor- dinate display)
	 Displaying jobs by operating the direct open function
	 The operation of UNDO and REDO
	Four point teaching
	Executing TRT

5 Editing Jobs

This section explains how to manage the jobs without moving the manipulator. Copying, deleting, and modifying of the jobs can be done only in the teach mode. Other operations can be done in any mode.

	Editing Move Instructions
	See <i>chapter 3 "Teaching</i> " for basic information on editing move instructions.
	• It is not possible to add, delete, or modify move instruc- tions which have position data. See <i>chapter 3.4 "Modify-</i> <i>ing Steps"</i> for details.
	 The following MOV instruction edit operations are explained in this section:
NOTE	For move instructions:
•	 Insertion, deletion, or modification of additional items
	 Modification of interpolation type or play speed for move instructions
	 Setting, modification, or deletion of UNTIL statements (interruption conditions based on input signals)
	 Setting and deletion of NWAIT instructions
	For move instructions using position variables:
	 Insertion and deletion of move instruction.

Refer to *chapter 1.2.6 "Character Input Operation"* for the character input operation.

5.5 Job Folder Function

This function enables to classify the jobs in each folder.

The jobs can be classified and displayed, so the visibility improves.

Up to 100 folders, including NONE (no folders), can be registered to this function.

For the folder name, up to 32 one-byte characters can be used.

However, the name of NONE (no folders) cannot be changed.

5.5.1 Displaying Jobs by Folders

5.5.1.1 Operation for Displaying Jobs by Folders

For displaying the jobs by folders, follow the procedures below.

1. Display the {JOB LIST} window.

JOB CONTENT window for "JOB-C"

- 6 Convenient Functions
- 6.1 One-touch Operation "Direct Open"

6.1.2 Direct Open of the JOB CONTENT Window

- 1. In the JOB CONTENT window, move the cursor to a job name or a condition file.
- 2. Press [DIRECT OPEN].
 - (1) For a job name
 - The lamp on [DIRECT OPEN] blinks, and the JOB CONTENT window appears.
 Direct open can be repeatedly performed in the window opened by the direct-open operation.
 - Press [SHIFT] + [DIRECT OPEN] to return to the previous JOB CONTENT window.
 When the window is returned to the first JOB CONTENT window, the lamp turns OFF.
 - (2) For a condition file, etc.
 - The lamp on [DIRECT OPEN] lights up, and the CONDITION FILE window, etc. appears.
 - Press [DIRECT OPEN] again to return to the former JOB CONTENT window. The lamp turns OFF.
 - If another window is selected while the direct open function is effective, the function is automatically canceled and the lamp on the direct open key goes out.
 - Once another JOB CONTENT window is opened by the direct open function, the former job cannot be continuously operated. (Stopped until the opened JOB CONTENT window is closed.)

6.1.3 Direct Open of the JOB LIST Window

- 1. In the JOB LIST window, move the cursor to a job name.
- 2. Press [DIRECT OPEN].
 - The lamp on [DIRECT OPEN] lights up, and the JOB VIEW window appears.
 - Press [DIRECT OPEN] again to return to the JOB LIST window. The lamp turns OFF.

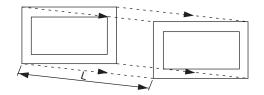

6 Convenient Functions

6.2 Parallel Shift Function

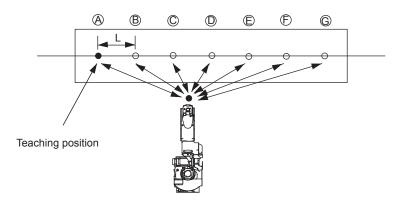

6.2 Parallel Shift Function

6.2.1 Function Overview

Parallel shift refers to the shifting of an object from a fixed position in such a way that all points within the object move an equal distance. In the model for parallel shift shown in the following, the shift value can be defined as the distance L (three-dimensional coordinate displacement). The parallel shift function is relevant to the actual operation of the manipulator because it can be used to reduce the amount of work involved in teaching by shifting a taught path (or position).

In the example in the figure below, the taught position A is shifted in increments of the distance L (this is actually a three-dimensional XYZ displacement that can be recognized by the robot) in order to enable the operation that was taught at position A to also be performed at positions B through G.

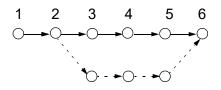

- 6 Convenient Functions
- 6.2 Parallel Shift Function

6.2.1.1 Parallel Shift of Step

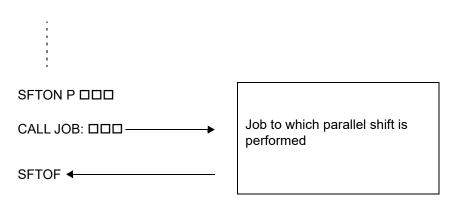

The block from the SFTON to the SFTOF instructions is subject to the shift operation.

Line (Step)	Instruction		
0000	NOP		
0001(001)	MOVJ VJ=50.00		
0002(002)	MOVL V=138		
0003	SFTON PDDDUF# (1)	\mathbf{i}	
0004(003)	MOVL V=138		
0005(004)	MOVL V=138		Shifted block
0006(005)	MOVL V=138		
0007	SFTOF		
0008(006)	MOVL V=138		

6.2.1.2 Parallel Shift of Job

Parallel shift is performed for a job.

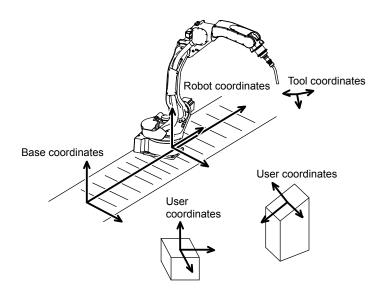

- 6 Convenient Functions
- 6.2 Parallel Shift Function

6.2.2 Setting the Shift Value

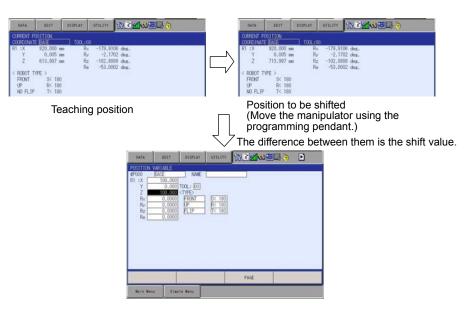

6.2.2.1 Coordinate Systems

The shift amount of parallel shift is denoted by the increments of X, Y, and Z in a coordinate system. Four types of coordinate systems are available: the base coordinates, the robot coordinates, the tool coordinates, and the user coordinates. In a robot system with no servo track, the base coordinates and the robot coordinates are the same. Note that the teaching line coordinates cannot be used.

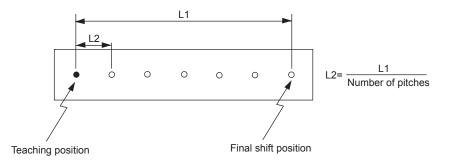

6.2.2.2 Setting the Shift Value

When setting the shift value for the position variables, use the current position (coordinates) of the manipulator in the window

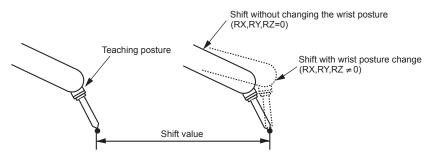

- 6 Convenient Functions
- 6.2 Parallel Shift Function

The shift value is the X, Y, and Z difference between the shift position and teaching position and the difference in angular displacement RX, RY, And RZ (normally set at "0"). If shifting is executed at equal pitch intervals, for example for palletizing, find the difference between the teaching position and the final shift position, then divide by the number of pitch intervals (number of divisions) to calculate the shift value per pitch.

The posture of the wrist is defined by the angular displacement of the coordinates of the wrist axes. Consequently, if the shift value is specified with X, Y, and Z only (RX, RY, RZ=0), the wrist is shifted while maintaining the same posture as at the teaching point. Since shifting is normally performed without changing the posture, there is no need to specify an angular displacement for the wrist. The motion when a parallel shift is performed is shown in the following:

The shift value is calculated on the position data window for the coordinates in which the shift is performed. Since this is normally performed in the user coordinates, the position data window for the user coordinates is used.

The shift amount of posture displacement (Rx, Ry, Rz) in the Cartesian coordinates is not calculated by the difference of degrees between the components of posture at the shifted position and the components of posture at the taught position. To calculate the shift amount with the posture displacement

To calculate the shift amount with the posture displacement values (Rx, Ry, Rz), use the MSHIFT instruction described in *chapter 6.2.3.3 "MSHIFT Instruction"*.

- 6 Convenient Functions
- 6.2 Parallel Shift Function

6.2.3 Registering Shift Instructions

To register the instruction, move the cursor to the address area in the JOB CONTENT window during teach mode as follows:

- 1. Select {JOB} under {Main Menu}.
- 2. Select {JOB}.
 - The JOB CONTENT window appears.

3. Move the cursor to the address area.

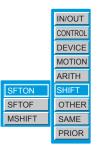

6.2.3.1 SFTON Instruction

This is the instruction that starts a parallel shift.

1. Move the cursor to the line immediately before where the SFTON instruction is to be registered.

	0001 0002	MOVJ VJ=50.00 MOVL V=138
SFTON instruction	0003	MOVL V=138
is to be registered.		

- 2. Press [INFORM LIST].
 - The instruction list dialog box appears.

- 3. Select {SHIFT}.
- 4. Select the SFTON instruction.
 - The SFTON instruction is displayed in the input buffer line.

- 6 Convenient Functions
- 6.2 Parallel Shift Function
- 5. Modify the additional items or number values as required.
 - <When Nothing is to be Changed> Proceed to Step 6.

<When Editing Additional Items>

- · Adding or modifying additional items
- To change the position variable number, move the cursor to the position variable number and press [SHIFT] + the cursor to increase or decrease the value.

	⇒ SFTON P000	
To dire	ectly input the value using the [Numeric Keys], pre	ess

[SELECT] to display the input buffer line.

- (2) After the number is input, press [ENTER] to modify the number value in the input buffer line.
- Adding the coordinate system in which the shift is performed
- Move the cursor to the instruction in the input buffer line and press [SELECT]. The DETAIL EDIT window appears.

- 6 Convenient Functions
- 6.3 Parallel Shift Job Conversion Function

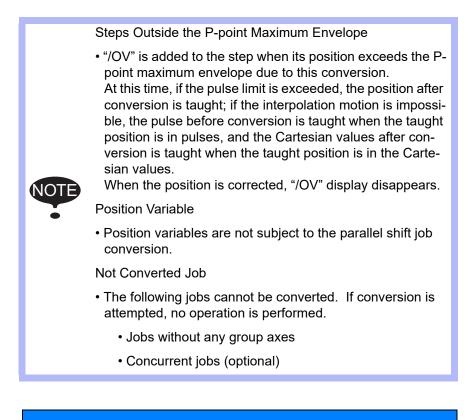

6.3 Parallel Shift Job Conversion Function

6.3.1 Function Overview

If the manipulator and base positions are moved after a job has been taught, the entire job has to be modified. The parallel shift conversion function shortens the modification time required in cases like this by shifting all steps of the job by the same value to create a new job.

When the parallel shift conversion is performed, all job steps are shifted by the same value.

NOTICE

 If a job name after conversion is not specified when executing the parallel shift job conversion, the position data of the job is shifted and converted, then the data is overwritten with a new position data after the shift. Be sure to save the job in the external memory device or create the same job by copying before executing conversion.

- 6 Convenient Functions
- 6.3 Parallel Shift Job Conversion Function

6.3.2 Coordinate Systems for Conversion

When performing the parallel shift job conversion, it is necessary to specify the coordinate systems in which the conversion is to be performed. The coordinate system can be selected from the following:

- Base coordinates
- Robot coordinates
- Tool coordinates
- User coordinates (64 types)
- Master tool coordinates (R*+R* job)
- · Pulse coordinates

In the case of an ordinary job for which group axes are registered, shift conversion is performed in accordance with the selected coordinate system. The relationship between group combinations and coordinates are shown in the following table.

1 to 4 in the table are followed by their explanations.

Group	Exp	lanation					
Combination in Job		Usable Coordinat	e System				
R	Shift	is performed on the	basis of selected coordinates.				
		Base coordinates, robot coordinates, tool coordinates, user coordinates, pulse coordinates					
R(B)	Shift	is performed on the basis of selected coordinates.					
		1. Base CoordinatesThe base axis is shifted by the specified amount and the TCF manipulator is shifted by the s amount in the base coordinate					
		2. Robot Coordinates	The base axis is shifted by the specified amount. The TCP of the manipulator is shifted by the specified amount in the robot coordinates. These shifts are carried out independently.				
		3. Tool Coordinates	The base axis is shifted by the specified amount. The TCP of the manipulator is shifted by the specified amount in the tool coordinates. These shifts are carried out independently.				
	Coordinates specified amount manipulator is shi		The base axis is shifted by the specified amount and the TCP of the manipulator is shifted by the specified amount in the user coordinates.				
		5. Pulse The taught position of each axis is shifted by the specified amount or basis of pulse values.

6.3.3 Executing the Parallel Shift Job Conversion

6.3.3.1 Window Display

A. SOURCE JOB

Selects the job before conversion. The job which is shown in the JOB CONTENT window is set initially. To change the job, perform the following procedure.

Move the cursor to the job name and press [SELECT]. The JOB LIST window appears. Select the desired job.

B. STEP SECTION (Start Step \rightarrow End Step)

Specifies the step section of the source job. All the steps are set initially. If there is no step in the source job, "***" is displayed. To change the section, perform the following procedure.

Move the cursor to the step section indication and press [SELECT]. The input buffer line appears. Input the step number and press [ENTER].

C. DESTINATION JOB

Specifies the converted job. If this is not specified ("*******" is displayed), the source job is overwritten with a job after conversion. If the converted job is specified, the source job is copied and converted. To change the job, perform the following procedure.

Move the cursor to the converted job name indication and press [SELECT]. The character input line appears. The source job name is displayed in the input line. To enter a job name without using the source job name, press [CANCEL] and then input a job name.

D. COORDINATES

Selects the conversion coordinates. Move the cursor to the coordinates name and press [SELECT]. The selection dialog box appears. Select the desired coordinates.

When the user coordinates are selected, the input buffer line appears. Input the desired user coordinate number and press [ENTER].

E. BASE POINT

Calculates the difference by the two teaching points as a shift value.

- 6 Convenient Functions
- 6.3 Parallel Shift Job Conversion Function

F. SHIFT VALUE

The axis shown is varied according to the setting of "4. coordinates" above.

Move the cursor to the input box and press [SELECT] to directly input the shift value.

If the shift value is calculated by the two teaching points, the difference is shown as a shift value.

6.3.3.2 Parallel Shift Job Conversion Operation

There are two methods for specifying the shift value.

- Directly input the shift value by numerical value.
- Calculate the shift value by teaching the original base point and converted base point.

The method using position variables by parameter setting is described in *chapter 6.3.4 "Specifying the Shift Value by Position Variables"* other than above two methods.

The following are the operation procedures by each setting of shift value for parallel shift job conversion.

Numerical Value Input

- 1. Select {JOB} under {Main Menu}.
- 2. Select {JOB}.
 - The JOB CONTENT window appears.
- 3. Select {UTILITY} under the pull-down menu.
- 4. Select {PARALLEL SHIFT JOB}.
 - The PARALLEL SHIFT JOB window appears.

Main Menu	Sim	ple Menu				ĺ

A. FILE NO.

Specifies position variables.

B. SHIFT JOB NAME

The job which was shown in the JOB CONTENT window is set initially. To change the job, perform the following procedure.

Move the cursor to the conversion job name and press [SELECT]. The JOB LIST window appears. Move the cursor to the desired job and press [SELECT]. The PARALLEL SHIFT JOB window reappears, and the job name which was selected is shown.

C. MODE

Specifies the conversion mode.

SINGLE (INDEPENDENT JOB CONVERSION)

Only the selected job is converted even if the selected job includes the jobs called by JUMP or CALL instructions. Related jobs are not converted.

RELATIVE (RELATIVE JOB CONVERSION)

Both the selected job and all the related jobs (the jobs called by JUMP or CALL instructions) are converted.

For details of each conversion mode, refer to *chapter 6.3.4.2 "Jobs Targeted for Conversion"*.

- 6 Convenient Functions
- 6.3 Parallel Shift Job Conversion Function

D. COORDINATES

Selects the conversion coordinates.

Move the cursor to the coordinates name and press [SELECT]. The selection dialog box appears. Select the desired coordinates. When the user coordinates are selected, the input buffer line appears. Input the desired user coordinate number and press [ENTER].

E. CONV. METHOD

Specifies the conversion methods of related jobs such as a coordinated job with two manipulators or the system with multiple stations. COMMON (COMMON SHIFT)

All the manipulators (or all the bases, or all the stations) are converted by the same shift value.

EACH (INDIVIDUAL SHIFT)

Each manipulator (or each base, or each station) is converted separately by different shift values.

For details of each conversion method, refer to

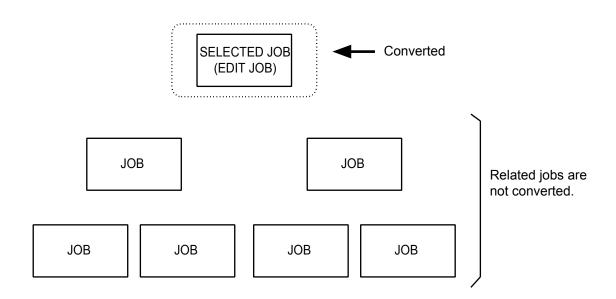

chapter 6.3.4.3 "Conversion of Coordinated Jobs".

- 6 Convenient Functions
- 6.3 Parallel Shift Job Conversion Function

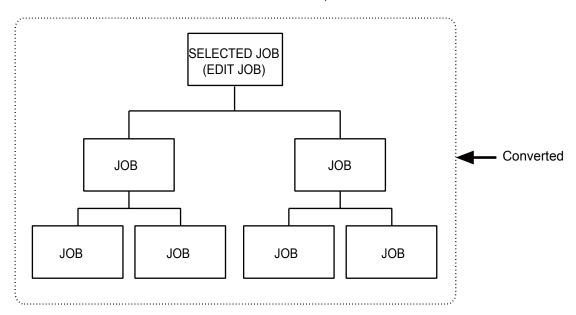

6.3.4.2 Jobs Targeted for Conversion

There are two ways to specify the job to be converted as described in the following:

Independent Job Conversion
 Only the selected job is converted even if the selected job includes
 the jobs called by JUMP or CALL instructions. Related jobs are not
 converted.

• Related Job Conversion Both the selected job and all the related jobs (the jobs called by JUMP or CALL instructions) are converted.

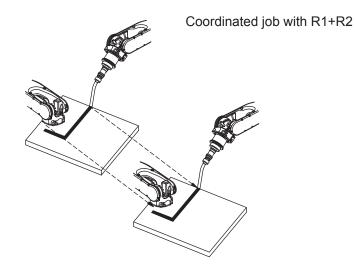

- 6 Convenient Functions
- 6.3 Parallel Shift Job Conversion Function

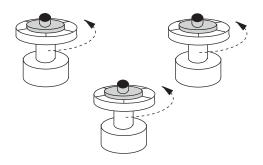

6.3.4.3 Conversion of Coordinated Jobs

There are two ways to convert a related job such as a coordinated job with two manipulators or the system with multiple stations as described in the following:

Common Shift

All the manipulators (or all the bases, or all the stations) are converted by the same shift value.

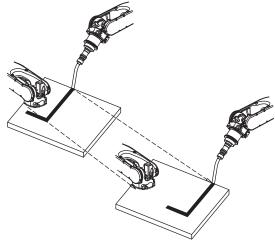

- 6 Convenient Functions
- 6.3 Parallel Shift Job Conversion Function

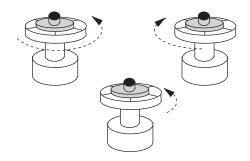

Individual Shift

Each manipulator (or each base, or each station) is converted separately by different shift values.

Coordinated job with R1+R2

The system with multiple stations

- 6 Convenient Functions
- 6.3 Parallel Shift Job Conversion Function

Variables used in an individual shift

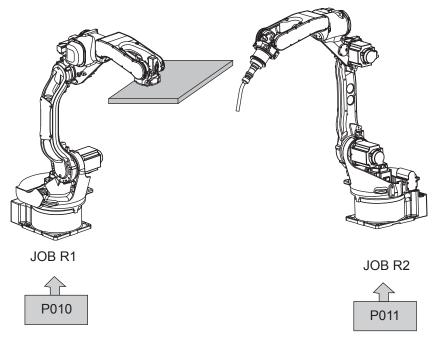

Be sure to use the variables of which numbers are consecutive after the selected number. The variables of which numbers are not consecutive are unable to be selected.

Example 1) When selecting P010 for a coordinated job with R1 + R2:

Use P010 for R1.

Use P011 for R2.

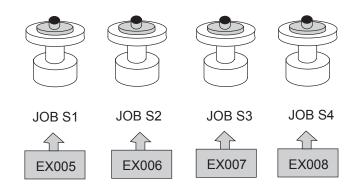

Example 2) When selecting EX005 for multiple jobs with four stations:

Use EX005 for S1.

Use EX006 for S2.

Use EX007 for S3.

Use EX008 for S4.

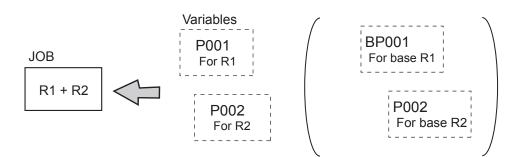

- 6 Convenient Functions
- 6.3 Parallel Shift Job Conversion Function

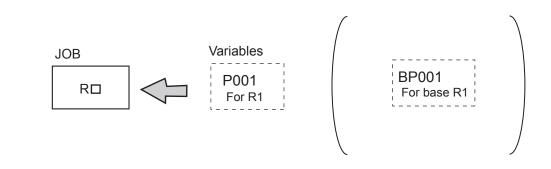

Relation between variables and jobs for conversion in an individual shift

■ In the case of independent job conversion:

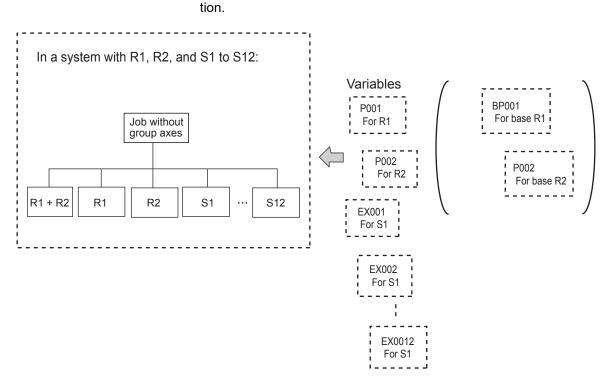

• Coordinated job with R1 + R2 Different shift values can be set for each manipulator and base.

• Job with R□ (+ S□) Use one variable for a job with one manipulator.

In the case of related job conversion:
 Different shift values can be set for each manipulator, base, and sta-

 - If an alarm occurs during conversion, conversion is suspended.

- Specify the position variable in advance when using the setting value as a shift value.
- The line to which the Edit Lock function is set or the comment out is performed cannot be changed. (For details, refer to *chapter 3.7.6 "Commenting Out a Line"* and *chapter 3.7.7 "Prohibiting Editing Line-by-Line"*.)

- 6 Convenient Functions
- 6.4 PAM Function

6.4 PAM Function

6.4.1 Function Overview

The function for position adjustment during playback (PAM: Position Adjustment by Manual) allows position adjustment by simple operations while observing the motion of the manipulator and without stopping the manipulator. Positions can be adjusted in both teach mode and play mode.

The following data can be adjusted by key input from the programming pendant.

- Teaching Point (Position)
- Teaching Point (Posture angle)
- Operation Speed
- Position Level

6.4.1.1 Input Ranges for Adjustment Data

The input ranges for adjustment data are indicated in the following table.

Data	Input Range	Remarks
Number of Steps for Adjustment	Up to 10 steps can be adjusted at the same time.	
Position Adjustment Range (X, Y, Z)	Unit: mm, valid to two decimal places, maximum ±10 mm	
Posture Angle Adjustment Range (Rx, Ry, Rz)	Unit: deg, valid to two decimal places, maximum ±10 deg	
Speed Adjustment Range (V)	Unit: %, valid to two decimal places, maximum ±50%	Play speed VMAX cannot be modified
PL Adjustment Range	0 to 8	
Adjustment Coordinates	Robot coordinates, base coordinates, tool coordinates, user coordinates (Default coordinates: robot coordinates)	

	The input ranges for adjustment data can be changed by the following parameters:
	S3C1098: Position adjustment range (unit: 0.001 mm)
SUPPLE	S3C1099: Speed adjustment range (unit: 0.01%)
-MENT	 S3C1100: Adjustment coordinate specification
	• S3C1102: Posture angle adjustment range (unit: 0.01 deg)
	For details, refer to chapter 8 "Parameter".

- 6 Convenient Functions
- 6.4 PAM Function
 - Base axis and station axis data cannot be adjusted.
 - Adjustment when a TCP instruction is executed is performed by adjusting the data of the selected tool.
 - When the coordinates for adjustment are user coordinates, an error occurs if teaching has not been performed in the user coordinates.

- If an attempt is made to adjust "PL" when there is no "PL" in the step subject to the adjustment, an error occurs.
- Position variable and reference point steps cannot be adjusted. An error occurs if adjustment is attempted.
- An attempt to adjust the speed at the step where the speed tag VJ, V,VR,VE is not added or the play speed VMAX is specified cause an error.

- 6 Convenient Functions
- 6.4 PAM Function

6.4.2 Operating Methods

- 6.4.2.1 Setting Adjustment Data
 - 1. Select {JOB} under {Main Menu}.
 - 2. Select {JOB}.
 - The JOB CONTENT window (in the teach mode) or the PLAYBACK window (in the playback mode) appears.
 - 3. Select {UTILITY} under the pull-down menu.
 - 4. Select {PAM}.
 - The PAM window appears.

- 5. Set adjustment data.
 - Set adjustment data.
 - A. Job

Set the job name to be adjusted.

Line up the cursor and press [SELECT] to display the JOB LIST window.

Move the cursor to the desired job and press [SELECT] to set the adjusted job.

– B. Status

Shows the status of adjustment in the PAM function. "NOT DONE" appears when adjustment is not executed. "DONE" appears when the execution of adjustment is completed.

– C. Input Coord

Set the desired coordinates.

Line up the cursor and press [SELECT] to display the selection dialog box.

Move the cursor to the desired coordinate system and press [SELECT] to set the input coordinates.

– D. Step Number

Set the step number to be adjusted.

Line up the cursor and press [SELECT] to display the number input buffer line.

Input the step number and press [ENTER] to set the value.

- 6 Convenient Functions
- 6.4 PAM Function

- E. XYZ Coordinate Adjustment

Set the direction and amount of the X, Y, and Z coordinates. Line up the cursor with the data to be adjusted and press [SELECT] to display the number input buffer line.

Input the number data and press [ENTER] to set the adjusted data.

- F. Rx, Ry, Rz Coordinate Adjustment

Set the direction and amount of the Rx, Ry and Rz posture angles. Line up the cursor with the data to be adjusted and press [SELECT] to display the number input buffer line.

Input the number data and press [ENTER] to set the adjusted data.

- G. V Coordinate Adjustment

Set the speed.

Line up the cursor and press [SELECT] to display the number input buffer line.

Input the number data and press [ENTER] to set the adjusted data.

– H. PL

The position level of the job to be adjusted for the step set in "4. Step Number" is displayed, and the data can be modified.

When the position level is not decided, [-] is displayed, and cannot be set.

To modify the position level, line up the cursor, press [SELECT], input the number value and press [ENTER].

The line to which the Edit Lock function is set or the comment out is performed cannot be changed.

Following errors occur when performing the Edit Lock operation.

1011: EDIT LOCK is set for this line.

1012: This line is defined as a comment.

(For details, refer to *chapter 3.7.6 "Commenting Out a Line"* and *chapter 3.7.7 "Prohibiting Editing Line-by-Line"*.)

- 6 Convenient Functions
- 6.4 PAM Function

6.4.2.2 Executing the Adjustment

- Executing the Adjustment
 - 1. Touch "COMPLETE" on the screen.
 - The confirmation dialog box appears.

DATA EDIT	DISPLAY	UTILITY	12	2 🖌	1	📮 🙌

- 6 Convenient Functions
- 6.5 Mirror Shift Function

6.5 Mirror Shift Function

6.5.1 Function Overview

With the mirror shift function, a job is converted to the job in which the path is symmetrical to that of the original job. This conversion can be performed for the specified coordinate among the X-Y, X-Z, or Y-Z coordinate of the robot coordinates and the user coordinates.

The mirror shift function is classified into the following three: the pulse mirror-shift function, the robot-coordinates mirror-shift function, and the user-coordinates mirror-shift function.

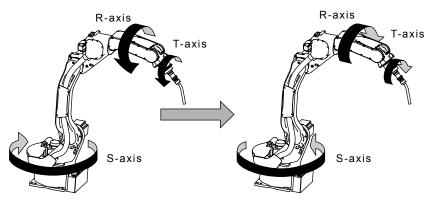

The original path before the mirror shift

The converted path after the mirror shift

- 6 Convenient Functions
- 6.5 Mirror Shift Function

6.5.2 Pulse Mirror-Shift Function

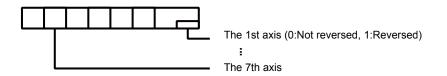

With the pulse mirror-shift function, the mirror shift is performed by reversing the sign (+/-) for the axes which are specified with the parameter in advance.

6.5.2.1 Parameter Setting

Using the following parameter, specify the axes for which the sign is to be reversed.

S1CxG065: Mirror Shift Sign Reversing Axis Specification

6.5.2.2 Object Job

Jobs without group axes and relative jobs cannot be converted.

6.5.2.3 Group Axes Specification

When specifying the group axes for the converted job in a multiple group axes system, the group axes specified in the original and converted jobs must be the same.

- Robot Axis: Same model
- Base Axis: Same configuration
- Station Axis: Same configuration

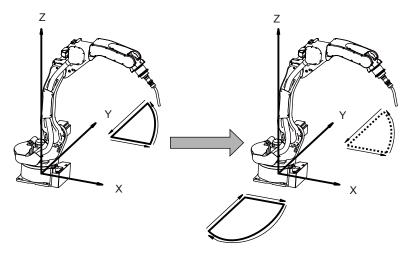

6.5.2.4 Position Variables

Position variables are not converted by the mirror shift function.

- 6 Convenient Functions
- 6.5 Mirror Shift Function

6.5.3 Robot-Coordinates Mirror-Shift Function

With the robot-coordinates mirror-shift function, the mirror shift is performed on the X-Z coordinate of the robot coordinates.

6.5.3.1 Object Job

Jobs without group axes cannot be converted.

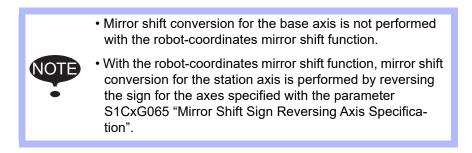

6.5.3.2 Group Axes Specification

When specifying the group axes for the converted job in a multiple group axes system, the group axes specified in the original and converted jobs must be the same.

- Robot Axis: Same model
- Base Axis: Same configuration
- Station Axis: Same configuration

6.5.3.3 Position Variables

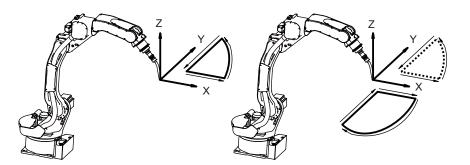

Position variables are not converted by the mirror shift function.

- 6 Convenient Functions
- 6.5 Mirror Shift Function

6.5.4 User-Coordinates Mirror-Shift Function

With the user-coordinates mirror-shift function, the mirror shift is performed on the X-Z, X-Y, or Y-Z coordinate of the specified user coordinates.

6.5.4.1 Object Job

Jobs without group axes cannot be converted.

6.5.4.2 Group Axes Specification

When specifying the group axes for the converted job in a multiple group axes system, the group axes specified in the original and converted jobs must be the same.

- Robot Axis: Same model
- Base Axis: Same configuration
- Station Axis: Same configuration

6.5.4.3 Position Variables

Position variables are not converted by the mirror shift function.

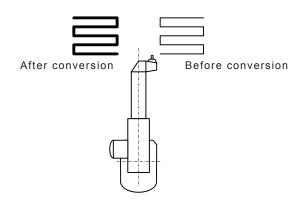

With the user-coordinates mirror shift function, mirror shift conversion for the station axis is performed by reversing the sign for the axes specified with the parameter S1CxG065 "Mirror Shift Sign Reversing Axis Specification".

- 6 Convenient Functions
- 6.5 Mirror Shift Function

6.5.5 Notes on the Mirror Shift Function

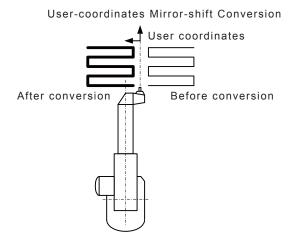

For manipulators, such as a polishing wrist, whose center of S-axis rotation and T-axis rotation are offset in the X-coordinate direction, the mirror shift cannot correctly be performed by the pulse mirror-shift function. Be sure to use the robot-coordinates mirror-shift function or use the user-coordinates mirror-shift function with the user coordinates specified on the center of the T-axis rotation.

 Using the Robot-coordinates Mirror-shift Function When the robot-coordinates mirror-shift function is performed, the mirror shift is performed on the X-Z coordinate of the robot coordinates. The path of the converted job is as follows:

Robot-coordinates Mirror-shift Conversion

(2) Using the User-coordinates Mirror-shift Function To use the user-coordinates mirror-shift function, specify the user coordinates on the center of T-axis rotation in advance.

"/OV" is added to the step when its position exceeds the Ppoint maximum envelope due to the conversion. For the step to which "/OV" is added, if the pulse limit is exceeded, the position after conversion is taught; if the interpolation motion is impossible, the pulse before conversion is taught when the taught position is in pulses, and the Cartesian values after conversion is taught when the taught position is in the Cartesian values.

- 6 Convenient Functions
- 6.5 Mirror Shift Function

6.5.6 Operation Procedures

6.5.6.1 Calling Up the JOB CONTENT Window

Call up the JOB CONTENT window of the job to be converted as follows:

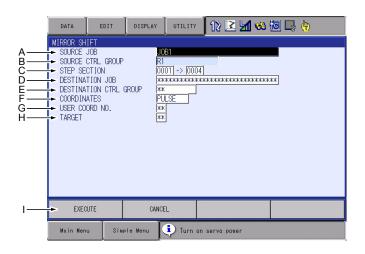

For Current Job

- 1. Select {JOB} under {Main Menu}.
- 2. Select {JOB}.
- For Another Job
 - 1. Select {JOB} under {Main Menu}.
 - 2. Select {SELECT JOB}.
 - The JOB LIST window appears.
 - 3. Select the desired job.

6.5.6.2 Mirror Shift Conversion

- 1. Display the JOB CONTENT window.
- 2. Select {UTILITY} under the pull-down menu.
- 3. Select {MIRROR SHIFT}.
 - The MIRROR SHIFT window appears.

- 6 Convenient Functions
- 6.5 Mirror Shift Function
- 6.5.6.3 Explanation of the Mirror Shift Window

A. SOURCE JOB

Selects the conversion source job.

To select another job to be converted, move the cursor to the name and press [SELECT] to call up the list of jobs. Select the desired job and press [SELECT].

B. SOURCE CTRL GROUP

Displays the control group of the conversion source job.

C. STEP SELECTION

Specifies the steps to be converted. From the first step to the last step of the selected job are specified as initial value.

D. DESTINATION JOB

Specifies the converted job name. To enter the name, move the cursor to the name and press [SELECT]. The name of the conversion source job is displayed in the input line as initial value. When "**" is displayed, the name for the converted job is to be the same as that of the conversion source job.

E. DEST CTRL GROUP

Selects the control group for the converted job. When the destination job name is entered, the same control group as the conversion source job is automatically set. To change it, move the cursor to the control group and press [SELECT] to call up the selection dialog box.

F. COORDINATES

Specifies the coordinates used for conversion.

- PULSE : Executes the pulse mirror-shift conversion.
- ROBOT : Executes the mirror-shift conversion on the basis of the Cartesian coordinates.
- USER : Executes the mirror-shift conversion on the basis of the specified user coordinates.

- 6 Convenient Functions
- 6.5 Mirror Shift Function

G. USER COORD NO.

Specifies the user coordinates number when "USER" is selected in "F. COORDINATES".

This item cannot be set when "PULSE" or "ROBOT" is selected in "F. COORDINATES".

H. TARGET

Specifies the coordinate where conversion is to be done when "ROBOT" or "USER" is selected in "F. COORDINATES". "XY", "XZ", or "YZ" can be selected. Always specify "XZ" for "ROBOT".

I. EXECUTE

Mirror shift conversion is executed when pressing {EXECUTE} or [ENTER]. A job is created with the name of conversion source job when a job after conversion is not entered.

- 6 Convenient Functions
- 6.6 Multi Window Function

6.6 Multi Window Function

6.6.1 Function Overview

Multi window function divides the general-purpose display area up to 4 windows and shows them simultaneously.

There are seven dividing patterns to be optionally choose as necessary.

Main Mer	u Simpl	e Menu				

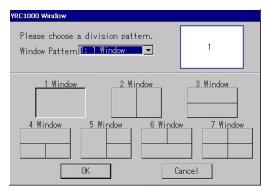

- 6 Convenient Functions
- 6.6 Multi Window Function

In the dividing pattern setting window, set the dividing pattern of the general-purpose display area.

1. Key operation 1:

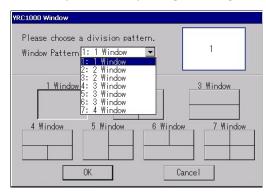

When "Window Pattern" is focused in the window, the option of the dividing pattern shifts as cursor moves upper or lower.

- Choose the desired dividing patter from the "Window Pattern".

2. Key operation 2:

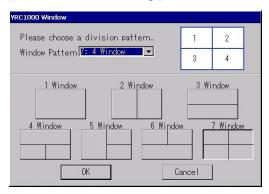

Press [SELECT] when "Window Pattern" is focused. The list of the dividing patterns appears. The list closes and a pattern is set after choosing the desired pattern and press [SELECT].

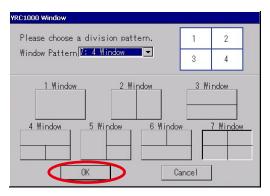

3. Touching operation:

The desired pattern can be chosen by touching a pattern in the window.

- Choose a pattern from the dividing pattern buttons.

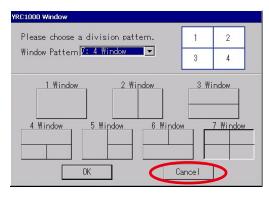

- 6 Convenient Functions
- 6.6 Multi Window Function
- 4. Touch [OK] button or move the cursor to it and press [SELECT].
 - The dividing pattern setting window closes and the chosen pattern (chosen with the procedure either 1, 2 or 3) appears.

Cancel the setting

- 1. Touch [CANCEL] button or move the cursor to it and press [SELECT].
 - Dividing pattern setting window closes. The dividing pattern in the general-purpose display area doesn't change.

The cursor moves by pressing [AREA] in the dividing pattern setting window.

- 6 Convenient Functions
- 6.6 Multi Window Function

6.6.3 Displaying the Multi Window

6.6.3.1 Multi Window Mode and Single Window Mode

Specifying more than two-window pattern in the dividing pattern setting window shows plural windows simultaneously in the general-purpose display area.

This is called multi window mode.

On the other hand, a single active window can be displayed with pressing [SHIFT] + [MULTI] operation.

This is called single window mode.

Pressing [SHIFT] + [MULTI] operation switches the display from single window mode to multi window mode. The mode can be changed as necessary.

6.6.3.2 Displaying the Status of Plural (More Than Two) Window Dividing Pattern Setting

When more than two windows are displayed as a desired pattern,

appears on the upper part of the window whereas it doesn't appear when a single window is displayed.

During the period before menu is selected when alarm occurred, the active window cannot be switched if alarm window is displayed, direct open is ON or a window is displayed by key allocation operation.

- 6 Convenient Functions
- 6.6 Multi Window Function

6.6.5 Switching the Axis Operation Control Group

The appropriate control group for axis operation is automatically selected in accordance with the window status or its operation in the active window. Due to this function, when the general-purpose display area is in multi window mode, the control group for axis operation can vary depending on the window which is active at the time.

To avoid unexpected control group to function and for the better safeness, the change of the control group with the [MULTI] operation or touching operation when switching the active window is notified to the user.

SUPPLE MENT The change of the control group for axis operation due to other than [MULTI] operation or touching operation; due to the switch of the window by selecting main menu, is not notified to the user.

6.6.5.1 S2C540 "Choosing Method of Notifying the Change of Axis Operation Control Group When Switching the Active Window"

The method to notify the change of control group for axis operation due to the switch of active window can be changed with parameter.

- Setting Value:0
- Keep displaying the message in the human interface display area for three seconds.
- Message "Control group switched by switching the active window" is displayed.

6.7.2.3 Conditions to Register the Layout

There are some cases that the layout patterns cannot be registered to "USER DEFINITION" menu. Followings are the conditions and the messages that the layout is refused to register.

	Condition	Message
1	when the layout is already registered.	This layout is already registered.
2	when eight layouts are already registered.	There is not an undefined domain.
3	When the registering layout includes the window which cannot be started up in the {Main Menu}.	The screen which I cannot register is included [W1W2W3W4] The screen which I cannot register is included [] (The number W1 to W4 indicates the windows which are actually displayed on the general-purpose display area, however, the highlighted numbered window cannot be registered. *For the layout of 1 to 4, refer to table 6-3 "Display the dividing Pattern".
4	When a single window is displayed under the multi window mode.	Cannot register at current operation mode. Cannot register at current operation mode

6 Convenient Functions

6.7 Simple Menu Function

The screens which cannot be started up in the {Main Menu} are impossible to register. Also, the layout of the screens that are called up from

{EXTERNAL MOMERY DEVICE} or ladder editor (optional function) cannot be registered.

6.7.2.4 The Displayed Layout Name

After a layout pattern is registered to "USER DEFINITION" menu, it is named in accordance with the status of the general-purpose display area when the layout pattern is created. Refer to the followings for the details.

	Status of general- purpose display area	Name registered to "USER DEFINITION" Menu			
1	Single window mode	(Same as the sub menu in main menu)			
2	Multi window mode	Layout -n ("n" should be a number from 0 to 7)			

It is possible to change the name even after the name is registered. Refer to chapter 6.7.4.3 "Changing the Name of Registered Layout Name".

6.7.3 Calling Up of the Registered Layout

6.7.3.1 Calling up

Call up the registered layout with the following procedures.

- 1. Press [SIMPLE MENU] or select {Simple Menu} button at the lower-left on the display.
 - "USER DEFINITION" menu appears.

6.8 Parameter Setting Function

6.8.1 Parameter Setting Function

Among the parameters explained in *chapter 8 "Parameter*", frequently used parameters' settings can be changed from the exclusive windows. Those windows are sorted out depending on the parameters' function as shown below.

- TEACHING CONDITION SETTING Teaching-relevant parameters are displayed.
- OPERATE CONDITION SETTING Mode switching/power-relevant parameters are displayed.
- OPERATE ENABLE SETTING ON/OFF of the manipulator-relevant parameters are displayed.
- FUNCTION ENABLE SETTING Enable/unable of optional function-relevant parameters settings are displayed.
- JOG CONDITION SETTING
 Operation of the jog-relevant parameters are displayed.
- PLAYBACK CONDITION SETTING Playback operation-relevant parameters are displayed.
- FUNCTIONAL CONDITION SETTING Execution of each function-relevant parameters are displayed.

Select above mentioned menu from {SETUP} window under main menu.

- 6 Convenient Functions
- 6.8 Parameter Setting Function

Move the cursor to select a menu, then the settings of the desired parameters can be changed by one of the following three methods according to its content.

• When there are two options.

The options alternate every time [SELECT] is pressed.

• When there are three or more options.

A dialog box with the options appears. Select one to change the settings.

• When it requires to input a value.

Input a value using [Numeric Keys] and press [ENTER] to change the settings.

6.9.1 Jog Key Allocation Function

This function enables to operate external axis without switching control groups by using operation keys of 7th-axis (E+, E-) and 8th-axis (8+,8-) on the programing pendant after setting any external axis to them.

E-) operational key.

This function can operate other control group than displayed in the upper part of the programming pendant (Status display area or the LED of [ROBOT] or [EX.AXIS]).

Also, the simultaneous operation of the robot and the external axes is possible by pressing several axis operational keys at a time. Please be careful to the axes movements when pressing them.

- 6 Convenient Functions
- 6.9 Jog Key Allocation

6.9.2 Jog Key Allocation Setting

6.9.2.1 Allocation of the Jog Key

NOTICE

• Allocation of the jog keys is valid only in the management mode while only confirmation of allocated axes is valid in the operation mode and edit mode.

The setup conditions are saved in the following parameters. Even if the same numbered external axes are allocated to a key (example:S1 for the 1st axis), the value of the parameter to be saved varies depending on the composition of the control group of the system. In this consequence, when loading the parameter file (ALL.PRM or AC.PRM), please make sure to confirm the allocating status before executing the function.

Parameters for saving the setup conditions of jog key allocation S2C739 7th axis S2C740 8th axis

 - A mark of robot is indicated at the left side of the status area on the programming pendant, and this expresses that the robot is selected to be the object of operation.
 Also, the LED of [ROBOT] lights.
- 2. Press 7th (E+,E-) axis or 8th (8+,8-) axis operation key.
 - The allocated external axes moves if there are no 7th and 8th axes and the allocation setting was done properly.

- 6 Convenient Functions
- 6.10 Energy Saving Function

6.10 Energy Saving Function

6.10.1 Energy Saving Function

Energy saving function is a function to save power by halting the power to the robot after applying brake to the motor when robot's all axes won't move for a designated period of time while servo is turned ON in play mode. The initial designated period of time is 10 minutes.

This energy saving function is valid when all the following condition met.

- 1. Energy saving function is valid.
- 2. The system input signal (the signal to prohibit on energy saving mode #40580) is turned OFF.

Followings are the status of the robot while this function is valid.

- 1. The message "On energy saving mode" is indicated on the programming pendant.
- 2. The servo is turned ON.
- 3. The jobs under execution are continuously executed.
- The system output signal (ENERGY SAVING:SOUT#0576(#50727))to indicate that it is in energy saving status is turned ON while other signals won't change.

NOTICE

- This function is canceled in the following cases:
 - When the programming pendant mode is switched to teach mode.
 - When the system input signal of external servo OFF(1,2,3) is input.
 - When the axis, which belongs to the subject control group of the executing job, is about to move while energy saving function is valid.
 - In the cases where emergency stop or servo OFF is executed when alarming.

This function will not be canceled if the system input signal (the signal to prohibit energy saving #40580) is turned ON. This signal merely prohibits to shift the status to energy saving status.

- 6 Convenient Functions
- 6.10 Energy Saving Function

6.11 Instruction Display Color Setting Function

6.11.1 Setting the Instruction Display Color on the Job Window

By using this function, each instruction can be displayed in each different color on the job window.

Display colors can be specified for the following instructions:

- Move instruction
- Work instruction
- Comment instruction
- Label instruction
- Macro instruction (when the macro function is enabled)
- I/O instruction
- Instruction to which LINE EDIT LOCK is specified
- Instruction to which LINE COMMENT is specified
- All the instructions other than listed above

The color of each instruction in the job window can be set on the DISPLAY COLOR CONDITION SETTING window.

1. Select {SETUP} under {Main Menu}.

6.12 Present Manipulator Position Output Function

6.12.1 Function for Outputting Present Cartesian Position of Manipulator to Register

6.12.1.1 Outline

The present Cartesian position of the manipulator (values in the base coordinates) is output to the specified registers.

6.12.1.2 Parameters

The following parameters specify the details of the function and output register numbers.

S1CxG	Description
208	Enables/Disables the function for outputting the present Cartesian position (in the base coordinates) to registers. (command value) 0: disable 1: enable
209	Specifies the output size to the register. 0: output in 2 bytes 1: output in 4 bytes
210	Cartesian position (command value) X register number of output destination
211	Cartesian position (command value) Y register number of output destination
212	Cartesian position (command value) Z register number of output destination
213	Cartesian position (command value) Rx register number of output destination
214	Cartesian position (command value) Ry register number of output destination
215	Cartesian position (command value) Rz register number of output destination
216	Cartesian position (command value) Re register number of output destination
217	Enables/Disables the function for outputting the present Cartesian position (in the base coordinates) to registers. (FB value) 0: disable 1: enable
218	Specifies the output size to the register. 0: output in 2 bytes 1: output in 4 bytes
219	Cartesian position (FB value) X register number of output destination
220	Cartesian position (FB value) Y register number of output destination
221	Cartesian position (FB value) Z register number of output destination
222	Cartesian position (FB value) Rx register number of output destination

- 6.12 Present Manipulator Position Output Function

6.12.2 Function for Outputting Present Pulse Position to Register

6.12.2.1 OutlineThe present position of the robot axis, the base axis, or the station axis in pulses is output to the specified registers.6.12.2.2 Parameters

The following parameters specify the details of the function and output register numbers.

S1CxG	Description		
202	Specifies the axis to apply the function 1 for outputting the present position in pulses to registers. (command value) The axis is specified in bits. Bit OFF: disable Bit ON: enable		
203	Specifies the axis to apply the function 1 for outputting the present position in pulses to registers. (FB value) The axis is specified in bits. Bit OFF: disable Bit ON: enable		
204	Specifies the output size to the register. Bit OFF: output in 2 bytes Bit ON: output in 4 bytes		
205	Specifies the axis to apply the function 2 for outputting the present position in pulses to registers. (command value) The axis is specified in bits. Bit OFF: disable Bit ON: enable		
206	Specifies the axis to apply the function 2 for outputting the present position in pulses to registers. (FB value) The axis is specified in bits. Bit OFF: disable Bit ON: enable		
207	Specifies the output size to the register. Bit OFF: output in 2 bytes Bit ON: output in 4 bytes		
1090 to 1097	Function 1 register number of output destination		
1100 to 1107	Function 1 resolution setting		
1110 to 1117	Function 1 offset value setting		
1120 to 1127	Function 2 register number of output destination		
1130 to 1137	Function 2 resolution setting		
1140 to 1147	Function 2 offset value setting		

- 6 Convenient Functions
- 6.12 Present Manipulator Position Output Function

2-byte output specification:

 (specified M register) = (pulse (command or FB)) / (resolution) + (offset value) [unit: pulse]

When the output size to the register is set to 2 bytes (no axis specified in S1CxG204 or S1CxG207), the pulse value in the size of 2 bytes will be output to the specified register number. If the size exceeds 2 bytes, only the lower 2 bytes will be output.

4-byte output specification:

- (specified M register) = Lower 2 bytes of {(pulse (command or FB)) / (resolution) + (offset value)} [unit: pulse]
- (specified M register + 1) = Upper 2 bytes of {(pulse (command or FB)) / (resolution) + (offset value)} [unit: pulse]

When the output size to the register is set to 4 bytes (an axis specified in S1CxG204 or S1CxG207), the lower 2 bytes will be output to the specified register number, and the upper 2 bytes will be output to the next number of the specified register number. Before performing setting, check the usage status of the registers.

<exam< th=""><th>ple 1</th><th>></th></exam<>	ple 1	>
--	-------	---

S1C1G	Setting value
202	63
203	0
204	0
1090	10
1091	11
1092	12
1093	13
1094	14
1095	15

When the parameters are set as shown in the above table, the present position is output to the registers as follows:

M010	= Present pulse position (command value)	S (1st axis)	[unit: pulse]
M011	= Present pulse position (command value)	L (2nd axis)	[unit: pulse]
M012	= Present pulse position (command value)	U (3rd axis)	[unit: pulse]
M013	= Present pulse position (command value)	R (4th axis)	[unit: pulse]
M014	= Present pulse position (command value)	B (5th axis)	[unit: pulse]
M015	= Present pulse position (command value)	T (6th axis)	[unit: pulse]

6 Convenient Functions

<Example 2>

6.12 Present Manipulator Position Output Function

•	
S1C1G	Setting value
202	0
203	63
204	63
1090	10
1091	12
1092	14
1093	16
1094	18
1095	20

When the parameters are set as shown in the above table, the present position is output to the registers as follows:

M010 = Lower 2 bytes of the	Present pulse position (FB value)	S (1st axis)	[unit: pulse]
M011 = Upper 2 bytes of the	Present pulse position (FB value)	S (1st axis)	[unit: pulse]
M012 = Lower 2 bytes of the	Present pulse position (FB value)	L (2nd axis)	[unit: pulse]
M013 = Upper 2 bytes of the	Present pulse position (FB value)	L (2nd axis)	[unit: pulse]
M014 = Lower 2 bytes of the	Present pulse position (FB value)	U (3rd axis)	[unit: pulse]
M015 = Upper 2 bytes of the	Present pulse position (FB value)	U (3rd axis)	[unit: pulse]
M016 = Lower 2 bytes of the	Present pulse position (FB value)	R (4th axis)	[unit: pulse]
M017 = Upper 2 bytes of the	Present pulse position (FB value)	R (4th axis)	[unit: pulse]
M018 = Lower 2 bytes of the	Present pulse position (FB value)	B (5th axis)	[unit: pulse]
M019 = Upper 2 bytes of the	Present pulse position (FB value)	B (5th axis)	[unit: pulse]
M020 = Lower 2 bytes of the	Present pulse position (FB value)	T (6th axis)	[unit: pulse]
M021 = Upper 2 bytes of the	Present pulse position (FB value)	T (6th axis)	[unit: pulse]

• If the pulse is a negative value, the pulse will be output to the register in 2's complement notation.

• Even in one control group, "command value" or "FB value" can be specified differently for each axis. However, if "command value" and "FB value" are specified for the same axis, the value "0" will be output to the register.

- If "0" is set as the resolution setting parameter (S1CxG1110 to 1117, S1CxG1130 to 1137), it will be treated as "1" when output to the register is performed.
- If "0" is set as the register number of output destination (S1CxG1090 to 1097, S1CxG1120 to 1127), the present pulse position will not be output to the register. Thus, no value can be output to the register number M000. Also, if the same register number of output destination is used more than twice, the former data will be overwritten by the latter data.

- 6.12 Present Manipulator Position Output Function

6.12.3 Function for Outputting TCP Speed to Register

6.12.3.1 Outline

The TCP (tool center point) speed of the manipulator is output to the specified registers.

6.12.3.2 Parameters

The following parameters specify the details of the function and output register numbers.

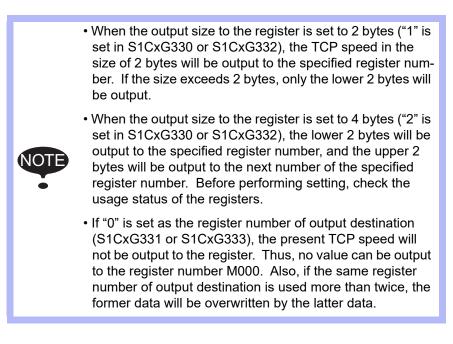

S1CxG	Description
330	Enables/Disables the function for outputting the TCP speed to registers. (command value) 0: no output to register 1: output in 2 bytes [unit: mm/sec] 2: output in 4 bytes [unit: µm/sec]
331	TCP speed (command value) register number of output destination
332	 Enables/Disables the function for outputting the TCP speed to registers. (FB value) 0: no output to register 1: output in 2 bytes [unit: mm/sec] 2: output in 4 bytes [unit: μm/sec]
333	TCP speed (FB value) register number of output destination

<Example 1>

S1C1G	Setting value
330	1
331	10
332	2
333	11

When the parameters are set as shown in the above table, the speed is output to the registers as follows:

M010 =	TCP speed (comman	d value)	[unit: mm/sec]
M011 =	Lower 2 bytes of the	TCP speed (FB value)	[unit: µm/sec]
M012 =	Upper 2 bytes of the	TCP speed (FB value)	[unit: µm/sec]

- 6 Convenient Functions
- 6.12 Present Manipulator Position Output Function

6.12.4 Function for Outputting Each Axis Speed to Register

6.12.4.1 Outline

The speed of each axis of the robot axis, the base axis, and the station axis is output to the specified registers.

6.12.4.2 Parameters

The following parameters specify the details of the function and output register numbers.

S1CxG	Description
334	 Enables/Disables the function for outputting each axis speed to registers. (command value) 0: no output to register 1: output in 2 bytes [unit: deg/sec (mm/sec for a linear motion axis)] 2: output in 4 bytes [unit: 0.0001 deg/sec (μm/sec for a linear motion axis)]
335	 Enables/Disables the function for outputting each axis speed to registers. (FB value) 0: no output to register 1: output in 2 bytes [unit: deg/sec (mm/sec for a linear motion axis)] 2: output in 4 bytes [unit: 0.0001 deg/sec (μm/sec for a linear motion axis)]
1270 to 1277	Each axis speed (command value) register number of output destination
1280 to 1287	Each axis speed (FB value) register number of output destination

<example 1=""></example>		
S1C1G	Setting value	
334	1	
335	0	
1270	10	
1271	11	
1272	12	
1273	13	
1274	14	
1275	15	

When the parameters are set as shown in the above table, the speed is output to the registers as follows:

= Each axis speed (command value)	S (1st axis)	[unit: deg/sec]
= Each axis speed (command value)	L (2nd axis)	[unit: deg/sec]
= Each axis speed (command value)	U (3rd axis)	[unit: deg/sec]
= Each axis speed (command value)	R (4th axis)	[unit: deg/sec]
= Each axis speed (command value)	B (5th axis)	[unit: deg/sec]
= Each axis speed (command value)	T (6th axis)	[unit: deg/sec]
	 = Each axis speed (command value) 	 = Each axis speed (command value) B (5th axis)

6 Convenient Functions

6.12 Present Manipulator Position Output Function

<Example 2>

S1C1G	Setting value
334	0
335	2
1280	10
1281	12
1282	14
1283	16
1284	18
1285	20

When the parameters are set as shown in the above table, the speed is output to the registers as follows:

M010 = Lower 2 bytes of the	Each axis speed (FB value)	S (1st axis)	[unit: 0.0001 deg/sec]
M011 = Upper 2 bytes of the	Each axis speed (FB value)	S (1st axis)	[unit: 0.0001 deg/sec]
M012 = Lower 2 bytes of the	Each axis speed (FB value)	L (2nd axis)	[unit: 0.0001 deg/sec]
M013 = Upper 2 bytes of the	Each axis speed (FB value)	L (2nd axis)	[unit: 0.0001 deg/sec]
M014 = Lower 2 bytes of the	Each axis speed (FB value)	U (3rd axis)	[unit: 0.0001 deg/sec]
M015 = Upper 2 bytes of the	Each axis speed (FB value)	U (3rd axis)	[unit: 0.0001 deg/sec]
M016 = Lower 2 bytes of the	Each axis speed (FB value)	R (4th axis)	[unit: 0.0001 deg/sec]
M017 = Upper 2 bytes of the	Each axis speed (FB value)	R (4th axis)	[unit: 0.0001 deg/sec]
M018 = Lower 2 bytes of the	Each axis speed (FB value)	B (5th axis)	[unit: 0.0001 deg/sec]
M019 = Upper 2 bytes of the	Each axis speed (FB value)	B (5th axis)	[unit: 0.0001 deg/sec]
M020 = Lower 2 bytes of the	Each axis speed (FB value)	T (6th axis)	[unit: 0.0001 deg/sec]
M021 = Upper 2 bytes of the	Each axis speed (FB value)	T (6th axis)	[unit: 0.0001 deg/sec]

• When the output size to the register is set to 2 bytes ("1" is set in S1CxG334 or S1CxG335), the axis speed in the size of 2 bytes will be output to the specified register number. If the size exceeds 2 bytes, only the lower 2 bytes will be output.

- When the output size to the register is set to 4 bytes ("2" is set in S1CxG334 or S1CxG335), the lower 2 bytes will be output to the specified register number, and the upper 2 bytes will be output to the next number of the specified register number. Before performing setting, check the usage status of the registers.
- If "0" is set as the register number of output destination (S1CxG1270 to 1277, S1CxG1280 to 1287), the present axis speed will not be output to the register. Thus, no value can be output to the register number M000. Also, if the same register number of output destination is used more than twice, the former data will be overwritten by the latter data.

6.12.5 Function for Outputting Each Axis Position to Register

6.12.5.1 Outline

The position of each axis of the robot axis, the base axis, and the station axis is output to the specified registers.

6.12.5.2 Parameters

The following parameters specify the details of the function and output register numbers.

S1CxG	Description
336	 Enables/Disables the function for outputting each axis position to registers. (command value) 0: no output to register 1: output in 2 bytes [unit: deg (mm for a linear motion axis)] 2: output in 4 bytes [unit: 0.0001 deg (μm for a linear motion axis)]
337	 Enables/Disables the function for outputting each axis position to registers. (FB value) 0: no output to register 1: output in 2 bytes [unit: deg (mm for a linear motion axis)] 2: output in 4 bytes [unit: 0.0001 deg (μm for a linear motion axis)]
1290 to 1297	Each axis position (command value) register number of output destination
1300 to 1307	Each axis position (FB value) register number of output destination

<example 1=""></example>		
S1C1G	Setting value	
336	1	
337	0	
1290	10	
1291	11	
1292	12	
1293	13	
1294	14	
1295	15	

When the parameters are set as shown in the above table, the position is output to the registers as follows:

M010	= Each axis position (command value)	S (1st axis)	[unit: deg]
M011	= Each axis position (command value)	L (2nd axis)	[unit: deg]
M012	= Each axis position (command value)	U (3rd axis)	[unit: deg]
M013	= Each axis position (command value)	R (4th axis)	[unit: deg]
M014	= Each axis position (command value)	B (5th axis)	[unit: deg]
M015	= Each axis position (command value)	T (6th axis)	[unit: deg]

6 Convenient Functions

6.12 Present Manipulator Position Output Function

<Example 2>

S1C1G	Setting value
336	0
337	2
1300	10
1301	12
1302	14
1303	16
1304	18
1305	20

When the parameters are set as shown in the above table, the position is output to the registers as follows:

M010	= Lower 2 bytes of the	Each axis position (FB value)	S (1st axis)	[unit: 0.0001 deg]
M011	= Upper 2 bytes of the	Each axis position (FB value)	S (1st axis)	[unit: 0.0001 deg]
M012	= Lower 2 bytes of the	Each axis position (FB value)	L (2nd axis)	[unit: 0.0001 deg]
M013	= Upper 2 bytes of the	Each axis position (FB value)	L (2nd axis)	[unit: 0.0001 deg]
M014	= Lower 2 bytes of the	Each axis position (FB value)	U (3rd axis)	[unit: 0.0001 deg]
M015	= Upper 2 bytes of the	Each axis position (FB value)	U (3rd axis)	[unit: 0.0001 deg]
M016	= Lower 2 bytes of the	Each axis position (FB value)	R (4th axis)	[unit: 0.0001 deg]
M017	= Upper 2 bytes of the	Each axis position (FB value)	R (4th axis)	[unit: 0.0001 deg]
M018	= Lower 2 bytes of the	Each axis position (FB value)	B (5th axis)	[unit: 0.0001 deg]
M019	= Upper 2 bytes of the	Each axis position (FB value)	B (5th axis)	[unit: 0.0001 deg]
M020	= Lower 2 bytes of the	Each axis position (FB value)	T (6th axis)	[unit: 0.0001 deg]
M021	= Upper 2 bytes of the	Each axis position (FB value)	T (6th axis)	[unit: 0.0001 deg]

- If the axis position is a negative value, the axis position will be output to the register in 2's complement notation.
- When the output size to the register is set to 2 bytes ("1" is set in S1CxG336 or S1CxG337), the axis position in the size of 2 bytes will be output to the specified register number. If the size exceeds 2 bytes, only the lower 2 bytes will be output.

- When the output size to the register is set to 4 bytes ("2" is set in S1CxG336 or S1CxG337), the lower 2 bytes will be output to the specified register number, and the upper 2 bytes will be output to the next number of the specified register number. Before performing setting, check the usage status of the registers.
- If "0" is set as the register number of output destination (S1CxG1290 to 1297, S1CxG1300 to 1307), the present axis position will not be output to the register. Thus, no value can be output to the register number M000. Also, if the same register number of output destination is used more than twice, the former data will be overwritten by the latter data.

- 6 Convenient Functions
- 6.12 Present Manipulator Position Output Function

6.12.6 Function for Outputting Torque Command Value to Register

6.12.6.1 Outline

The torque command value of the manipulator is output to a register. The torque command value is the current torque command value of the measured axis. The torque command value is expressed as a percentage [%] with the rated motor torque of the axis as 100%.

6.12.6.2 Parameters

The following parameters specify the details of the function, output register numbers, and offsets.

S1CxG	Description
122	Specifies the output axis to apply the function for a outputting torque command value to a register. The axis is specified in bits. Bit OFF: disable Bit ON: enable
910 to 917	Specifies the register number of the output destination for outputting a torque command value to a register.
1060 to 1067	Specifies the offset for outputting a torque command value to a register.

Output specification

• (specified M register) = (torque command value) + (offset) [unit: %]

<Example 1>

S1C1G	Setting value
122	63
910	10
911	11
912	12
913	13
914	14
915	15

When the parameters are set as shown in the above table, the torque command values are output to the registers as follows:

M010	= Torque (command value)	S (1st axis)	[unit: %]
M011	= Torque (command value)	L (2nd axis)	[unit: %]
M012	= Torque (command value)	U (3rd axis)	[unit: %]
M013	= Torque (command value)	R (4th axis)	[unit: %]
M014	= Torque (command value)	B (5th axis)	[unit: %]
M015	= Torque (command value)	T (6th axis)	[unit: %]

- 6 Convenient Functions
- 6.12 Present Manipulator Position Output Function

• If "0" is set as the register number of the output destination (S1CxG910 to 917), the torque command value will not be output to the register. Thus, no value can be output to the register number M000. Also, if the same register number of the output destination is used more than once, the former data will be overwritten by the latter data.

• The update cycle for the register output values of the torque command values is approximately 100 msec.

- 6 Convenient Functions
- 6.12 Present Manipulator Position Output Function

6.12.7 Function for Outputting Present Cartesian Position (any coordinate) of Manipulator to Register (YAS4.13-00 or later)

6.12.7.1 Outline

The present Cartesian position of the manipulator is output to the specified registers by any specified coordinates (base coordinates, robot coordinates, user coordinates, master tool coordinates). This function is available in YAS4.71-00 or later. Also, master tool coordinates can only be used with the COORDINATED CONTROL FUNCTION (option).

6.12.7.2 Parameter

The following parameters specify the details of the function and the details of the coordinate, output register numbers.

S1CxG	Description
500	Enables/Disables function for outputting present cartesian position (in the any coordinate) of Manipulator to Register. (command value) 0: disable 1: enable
501	Specifying coordinates for function for outputting present cartesian position (in the any coordinate) of Manipulator to Register (command value) 0: base coordinates 1: robot coordinates 2: user coordinates 3: master tool coordinates (Only when using the COORDINATED CONTROL FUNCTION)
502	Coordinate specification details •For user coordinates User coord no.: 1-63 *If set to 0, it specifies the base coordinates •For master tool coordinates Control group number on the master side 1-8: robot R1-R8 9-16: base B1-B8 17-40: station S1-S24 *If set to 0, it specifies the base coordinates *If the selected control group does not exist, the calibration is undefined among the robots, then the base coordinates are specified
503	Specifies the output size to the register for function for outputting present cartesian position (in the any coordinate) of Manipulator to Register (command value). 0: output in 2 bytes 1: output in 4 bytes
504	present cartesian position (in the any coordinate) (command value) X register number of output destination (0: no output)
505	present cartesian position (in the any coordinate) (command value) Y register number of output destination (0: no output)
506	present cartesian position (in the any coordinate) (command value) Z register number of output destination (0: no output)
507	present cartesian position (in the any coordinate) (command value) Rx register number of output destination (0: no output)
508	present cartesian position (in the any coordinate) (command value) Ry register number of output destination (0: no output)
509	present cartesian position (in the any coordinate) (command value) Rz register number of output destination (0: no output)

6 Convenient Functions

6.12 Present Manipulator Position Output Function

S1CxG	Description
510	present cartesian position (in the any coordinate) (command value) Re register number of output destination (0: no output)
513	Enables/Disables function for outputting present cartesian position (in the any coordinate) of Manipulator to Register. (FB value) 0: disable 1: enable
514	 Specifying coordinates for function for outputting present cartesian position (in the any coordinate) of Manipulator to Register (FB value) 0: base coordinates 1: robot coordinates 2: user coordinates 3: master tool coordinates (Only when using the COORDINATED CONTROL FUNCTION)
515	Coordinate specification details • For user coordinates User coord no.: 1-63 *If set to 0, it specifies the base coordinates • For master tool coordinates Control group number on the master side 1-8: robot R1-R8 9-16: base B1-B8 17-40: station S1-S24 *If set to 0, it specifies the base coordinates *If the selected control group does not exist, the calibration is undefined among the robots, then the base coordinates are specified
516	Specifies the output size to the register for function for outputting present cartesian position (in the any coordinate) of Manipulator to Register (FB value). 0: output in 2 bytes 1: output in 4 bytes
517	present cartesian position (in the any coordinate) (FB value) X register number of output destination (0: no output)
518	present cartesian position (in the any coordinate) (FB value) Y register number of output destination (0: no output)
519	present cartesian position (in the any coordinate) (FB value) Z register number of output destination (0: no output)
520	present cartesian position (in the any coordinate) (FB value) Rx register number of output destination (0: no output)
521	present cartesian position (in the any coordinate) (FB value) Ry register number of output destination (0: no output)
522	present cartesian position (in the any coordinate) (FB value) Rz register number of output destination (0: no output)
523	present cartesian position (in the any coordinate) (FB value) Re register number of output destination (0: no output)

- 6 Convenient Functions
- 6.12 Present Manipulator Position Output Function
 - When Enables/Disables function for outputting present cartesian position (in the any coordinate) of Manipulator to Register (command value) is enabled (S1CxG500=1), be sure to set the output register number (S1CxG504 to 510) for each coordinate value. setting.
 - When Enables/Disables function for outputting present cartesian position (in the any coordinate) of Manipulator to Register (FB value) is enabled (S1CxG513=1), be sure to set the output register number (S1CxG517 to 523) for each coordinate value. setting.
 - When the output size to the register is set to 2 bytes (S1CxG503=0 or S1CxG516=0), the unit for X, Y, Z coordinate values is "mm", and the unit for Rx, Ry, Rz, Re coordinate values is "deg". If the coordinate value exceeds 2 bytes, only the lower 2 bytes will be output.

- When the output size to the register is set to 4 bytes (S1CxG503=1 or S1CxG516=1), the unit for X, Y, Z coordinate values is "μmm", and the unit for Rx, Ry, Rz, Re coordinate values is "0.0001 deg".
- When the output size to the register is set to 4 bytes (S1CxG503=1 or S1CxG516=1), the upper bytes of the coordinate value will be output to the next number of the specified register number. Before performing setting, check the usage status of the registers.
- If function for outputting present cartesian position (in the any coordinate) of Manipulator to Register (command value) and Function for Outputting TCP Speed (in the any coordinate) to Register (command value) are used at the same time, it is not possible to set different coordinate specifications for each.
- If function for outputting present cartesian position (in the any coordinate) of Manipulator to Register (FB value) and Function for Outputting TCP Speed (in the any coordinate) to Register (FB value) are used at the same time, it is not possible to set different coordinate specifications for each.

- 2. Select {Coordinate Change}.
 - When the displaying coordinate is a pulse,

the robot axis is changed to the angle display; the base axis is changed to the distance display; and the station axes is changed for each axis by the value of the station

axis display parameter (S2C265 to 288).

When the first bit is OFF, the first axis is changed to the angle display.

When the second bit is ON, the second axis is changed to the distance display.

When the display coordinate is angle/distance, the all axes are changed to the pulse display.

- 6.14 Job Edit Function During Playback
- 3. Select {WRITING} under the pull-down menu {JOB}.
 - If the job to be written to is listed in JOB LIST, a confirmation dialog "Overwrite?" appears. Select "YES" to reflect the edited data. If "NO" is selected, the edited data will not be reflected. To cancel writing, press [CANCEL] while the confirmation dialog appears. If the job with the same name is not listed in "JOB LIST", the job to be written to will be added to "JOB LIST". Refer to the "SUPPLEMENT" below.

If data is reflected during playback, the message "Requesting playback edit JOB writing" appears, and the status becomes a write request. To write the job, execute the instruction "LATESTJOB" in the write request status or end playback. If data is reflected in the play mode but not during playback, the job will be written immediately.

However, if the job to be written to is being executed (including jobs in the call stack),

"Error 5240: Cannot write in the JOB in execution." appears, and the edited data will not be reflected.

If a job in the call stack is written to in the play mode but not during playback,

"Error 5241: Cannot write in the JOB in JOB STACK." appears, and the edited data will not be reflected.

If data is reflected during teaching, the job will be written immediately.

- 6 Convenient Functions
- 6.14 Job Edit Function During Playback

6.14.2.4 Canceling Write Request

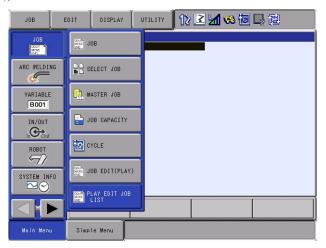

The procedure to cancel a write request is described below.

Canceling Write Request

 Select {Main Menu} {JOB}, then select the submenu {PLAY EDIT JOB LIST},

or

select {Main Menu} {JOB}, then select the submenu {JOB EDIT (PLAY)}.

2. Select {WRITING CANCEL} under the pull-down menu {JOB}.

6 Convenient Functions

6.14 Job Edit Function During Playback

NOTICE

When the mode switch is changed to the teach mode during job editing

Even if the mode switch is changed to the teach mode without reflecting or canceling the edited data, the changed data will be saved. In this case, select {Main Menu} {JOB}, then select the submenu {SELECT JOB} or {PLAY EDIT JOB LIST} to edit data in the same manner as in the play mode. However, position teaching cannot be done.

Regarding the job edited in the play mode, even after the mode is changed to the teach mode, the edited data will not be reflected if {WRITING} is not done.

Writing a job

{WRITING} operates differently depending on the status of the robot.

Select {JOB}, then select {WRITING} to reflect the edited data in the job. The data is reflected as described below depending on whether the job is being executed or not.

- 1. When the job is NOT being executed: The data is reflected immediately.
- 2. When the job is being executed: The data is reflected when the instruction "LATESTJOB" is executed or when the job execution is completed.

"Requesting playback edit JOB writing" appears while waiting for reflect operation (during a write request).

- The executing job cannot be written to even by the instruction "LATESTJOB".
- If a power failure occurs during a write request, the write request will be canceled upon restarting, and the job will not be reflected.
- During a file transfer

{WRITING} cannot be done during file transfer (i.e. external memory operation or data transmission).

In addition, a file cannot be transferred during a write request.

During a write request

Editing is inhibited during a write request (while "Requesting playback edit JOB writing" appears).

To edit data, wait for the writing to be completed or cancel the write request.

- 6 Convenient Functions
- 6.15 Logging Function

6.15 Logging Function

6.15.1 Logging Function

By using the logging function, the history (log) of the controller's operation, data editing, and job execution can be saved in chronological order and displayed on the screen.

The user can select operations to be logged and save the log data in an external device.

6.15.2 Data to be Logged

The following data can be saved by using this function:

- (*1) This is recorded starting from YAS4.10-00.
 - Operation log:
 - Mode switching (PLAY/TEACH/REMOTE) (Operations in the remote mode are also saved in logs.)
 - Safeguarding OPEN (PLAY)
 - Selecting a job (including direct open)
 - · Calling the master job
 - Initializing a file or job
 - Loading and saving a file or job (normal termination/abnormal termination)

(Loading and saving operations by the DCI function or the data transmission function are not saved in logs.)

- · Creating, deleting, renaming a job
- · Converting a job
 - Parallel shift job conversion, mirror shift job conversion, relative job conversion, user coordinates shift conversion, PAM (position correcting during playback), PMT (position correcting due to tool deformation), 4-point teaching
- · Changing the home position of the manipulator
- Login/logoff (Only available when the password protection function (optional) is used.)
- Turning ON/OFF the power supply
- Forced Cancel of WAIT Command (*1)
 - -From the {UTILITY} pull-down menu in the PLAYBACK window, select {SKIP WAIT INST} to record that the condition waiting status of the WAIT command was canceled. This is recorded only when condition waiting was canceled by user operation.
- Speed Override Operation (*1)

-This records whether the speed override status is set or canceled and whether the speed ratio was changed. Override that is performed using an external input signal (see *chapter 4.4.3 "Specification for Speed Override with Input Signals"*) is not recorded.

- 6 Convenient Functions
- 6.15 Logging Function
 - Interface Panel Button Operation (*1) (Option Function)
 - -This records that a button was pressed. The only buttons that are recorded are the buttons pressed when the I/O, variables, or registers are edited. When these buttons are pressed, an edit log of the data assigned to the buttons is also recorded simultaneously. Nothing is recorded for [VIEW ONLY] or [COUNTER] buttons or when button usage is disabled.

Button Type	Button Status When Log Recorded
HOLD-DOWN button	ON is recorded whenever this button is pressed.
PUSH button	ON is recorded when this button is pressed, and OFF is recorded when it is released.
SELECTOR SW	Even when the switch is set to {LEFT ON}, {RIGHT ON}, or {2 POINTS OUTPUTS}, ON is recorded whenever the button is pressed.
PRESET COUNTER	ON is recorded whenever this button is pressed.
OPERATE	{PERMIT} or {PROHIBIT} is recorded based on the button display status.

- Edit log
 - Job *Including edit jobs during playback (*1):
 - · Adding an instruction
 - · Changing conditions in an instruction
 - · Deleting an instruction
 - · Cut, paste, and reverse paste
 - UNDO and REDO
 - · Editing a job header
 - · Line edit lock and line commenting out
 - · Canceling all line edit lock, canceling all line commenting out
 - Creating, renaming, deleting, or writing to an edit job during playback (*1)
 - · Editing a condition file/general data
 - Editing a parameter
 - Editing the CIO

Editing on the ladder program window.

When compiling is executed, the edit histories (addition/modification/deletion of lines) are output together. The recorded times are the actual times at which the lines were edited, so they may not be the same as the time at which compiling was executed.

• Editing a variable (Operations in the remote mode are not saved in logs.)

- 6 Convenient Functions
- 6.15 Logging Function
 - Editing I/O

A log is recorded when the signals in the following table are switched ON/OFF.

Signal Type	Recording of ON/OFF Status	Recording of Forced Signal Output Status	Signal Number When Recorded
USER INPUT SIGNAL	° ₁)	° ²⁾	I/O number (1-4096) / Relay (#00010-#05127) ³⁾
USER OUTPUT SIGNAL	0	×	I/O number (1-4096) / Relay (#10010-15127) ³⁾
EXTERNAL INPUT SIGNAL	₀ 1)2)	° ₂)	Relay (#20010-#25127)
EXTERNAL OUTPUT SIGNAL	₀ 1)2)	° ²⁾	Relay (#30010-#35127)
I/F PANEL INPUT SIGNAL	₀ 2)	×	Relay (#60010-#60647)

1 This is recorded only when the forced signal output status is ENABLE.

2 This is recorded starting from YAS4.10-00.

3 Switchable by the S2C1585 d0 bit. (Bit OFF: I/O number, Bit ON: Relay number)

• Register editing (*1)

Only the editing operations performed by the user will be logged. If the status of a variable, I/O, or register is modified by an instruction in the job, etc., such modification will not be logged.

• Job execution log:

The job execution log can be saved when a job is started, completed, or stopped, and this log can be referred to later. For example, if the power supply is turned OFF for some reason and the job is stopped during execution, the job execution log can be used to make recovery operations easier.

- Job name
- Line number
- Task (local task number)
- Event (START, NEXT, BACK, TEST, STOP, PSTART (*1))
- Cause of stop
 - Completion of execution (execution of the instruction of a given line number is completed), END (END of the job), PAUSE instruction, ABORT instruction, servo OFF, hold, key OFF (key is released during FWD, BWD, or test operation), turning OFF of the power supply

Date

The job execution logs of JUMP, CALL, PSTART (independent control function), interrupt job, etc., in which jobs are switched during execution, are not saved.

- 6 Convenient Functions
- 6.15 Logging Function

6.15.3 Number of Stored Logs

The number of storable logs are as follows:

- Operation logs : 200
- Edit logs : 200
- Job execution logs : 200

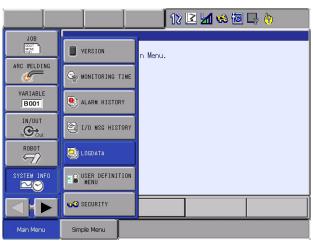

If the number described above is exceeded, old data will be deleted and new data will be saved.

6.15.4 Operating Methods

6.15.4.1 Displaying List of Logs

The log list can be referred to with the following procedures:

1. Select {Main Menu} \rightarrow {SYSTEM INFO} \rightarrow {LOGDATA}.

- 2. Select {LOGDATA}.
 - The LOGDATA window appears.

6.15.4.3 Updating Log Information

When a new log is added while displaying the {LOGDATA} window, pressing [SELECT] displays a confirmation dialog "The log was added. Update the display?". When selecting "YES", a log data is obtained again and the window is updated. When selecting "NO", the window display is not updated, but after that, when pressing [SELECT], the same dialog appears again.

When the log display type is set to "OPERATION", "EDIT", or "JOB EXECUTION", the confirmation dialog described above appears only when a log of the currently displayed type is added and [SELECT] is pressed.

6.16 Function of Analog Output Corresponding to Speed

6.16.1 Overview

The function of analog output corresponding to speed changes the analog output value automatically according to the manipulator's operating speed. This function does not need resetting of the analog output value according to the operating speed, so that the time required for job teaching can be reduced.

For example, in a sealing or painting operation where the thickness of sealant or paint must be constant, the feed amount of sealant or paint can be automatically controlled corresponding to the manipulator's operating speed.

The following circuit board is required for the function of analog output corresponding to speed:

• Analog output expansion board: JANCD-AEW02-E

- 6 Convenient Functions
- 6.16 Function of Analog Output Corresponding to Speed

6.16.2 Instructions

6.16.2.1 Instructions for the Function of Analog Output Corresponding to Speed

The instructions, ARATION and ARATIOF, are used for the function of analog output corresponding to speed.

ARATION

The function of analog output corresponding to speed is performed after executing ARATION instruction. This instruction is valid during circular interpolation, linear interpolation or spline interpolation. It is executed only at playback or [FWD] operation; it is not executed during axis operation.

This instruction is also used when each set value for the function of analog output corresponding to speed is to be changed.

ARATION	AO#(1)	BV=10.00	V=200.0	OFV=2.00	FINE	DELAY=1.00
	1	2	3	 ④	5	6

Output port number

General-purpose analog output port to execute the analog output corresponding to speed

Setting range: 1 to 40

②Base voltage

Voltage to be output at the speed set with the basic speed. Setting range: -14.00 to +14.00 V

3Base speed

Operating speed which becomes the basis for when the set voltage is output.

Setting range: 0.1 to 1500.0 mm/sec

1 to 9000 cm/min

④Offset voltage

Analog voltage when the operating speed is 0.

Setting range: -14.00 to +14.00 V

SFine output

Analog output is performed corresponding to the feedback speed, not corresponding to the command speed (the speed defined by path calculation).

When this tag is added, filtering will not be performed.

6Delay time

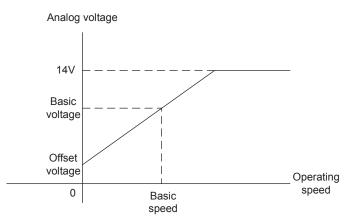

Delay time for the analog output corresponding to the feedback speed. Setting range: 0.00 to 10.00 sec

According to the set value of the ARATION instruction, the output characteristics for the relation between the operating speed and the analog voltage are calculated. The function of analog output corresponding to speed is executed depending on these output characteristics.

The following graph shows the output characteristics.

- 6 Convenient Functions
- 6.16 Function of Analog Output Corresponding to Speed

Fig. 6-5: Output Characteristics When the Function of Analog Output Corresponding to Speed is Used

When the analog output value exceeds \pm 14.00 V because of the operating speed, the value is limited within \pm 14.00 V.

ARATIOF

When the ARATIOF instruction is executed, the analog output corresponding to speed is completed, and the set offset voltage becomes the fixed output.

Output port number

General-purpose analog output port to end the analog output corresponding to speed Setting range: 1 to 40

- 6 Convenient Functions
- 6.16 Function of Analog Output Corresponding to Speed

6.16.2.2 Registration of Instructions

The instructions can be registered when the cursor is in the address area on the job content display in teach mode. Perform the following operations before registering an instruction.

- 1. Select {JOB} under {Main Menu}.
- 2. Select {JOB CONTENT}.
- 3. Move the cursor to the address area.

OTERMINAL

General-purpose analog output port

OUTPUT (V)

Indicates the voltage which is currently output.

3BASIC (V)

Indicates the basic voltage used for the analog output corresponding to speed.

This value is used until a new value is set by ARATION instruction.

(TRAIT)

Indicates the current output characteristics of the output port.

SP RAT: during execution of the analog output corresponding to speed STATIC: fixed output status

©OFFSET (V)

Indicates the offset voltage used for the analog output corresponding to speed.

This value is used until a new value is set by ARATION instruction.

\$6\$ BASIC SPD

Indicates the basic speed used for the analog output corresponding to speed.

This value is used until a new value is set by ARATION instruction.

⑦ROBOT

Indicates the manipulator number for the analog output corresponding to speed.

- 1. Select {IN/OUT} under the {Main Menu}.
- 2. Select {ANALOG OUTPUT}.
 - The analog output window appears. The output terminal numbers which follow the AOUT4 can be switched and displayed by pressing [PAGE].

6 Convenient Functions

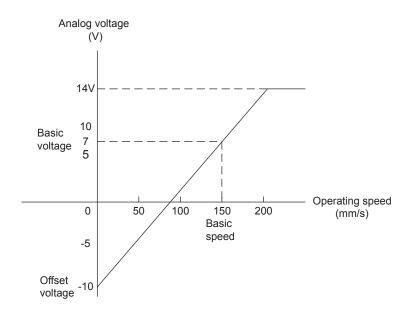

6.16 Function of Analog Output Corresponding to Speed

6.16.3 Examples

6.16.3.1 Example of Output Characteristics

The graph below shows the change in the output characteristics when the following job is done.

	Output Voltage (V)
MOVJ VJ=50.00	
ARATION AO#(1) BV=7.00 V=150.0 OFV=-10.00	7.00
MOVL V=50.0	-4.33
MOVC V=100.0	1.33
MOVC V=100.0	1.33
MOVC V=100.0	1.33
MOVL V=200.0	12.67

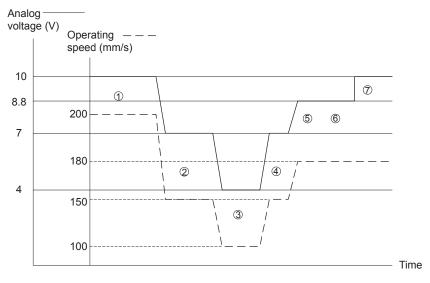

- 6 Convenient Functions
- 6.16 Function of Analog Output Corresponding to Speed
- 6.16.3.2 Example of Variation of Operating Speed and Analog Output Value

The following graph shows the change of the analog output according to the speed variation.

MOVL V=200.0・・・・① ARATION AO#(1) BV=10.00 V=200.0 OFV=-2.00 MOVC V=150.0・・・・② MOVC V=20.0・・・・③ (WhentheTCP(toolcenterpoint)speedis100mm/s) MOVC V=150.0・・・・④ MOVL V=180.0・・・・⑤ MOVL V=180.0・・・・⑤ MOVL・・・・⑥ (When the TCP speed is 180 mm/s) AOUT AO#(1) 10.00・・・・⑦

- Since the analog output corresponding to speed is made with respect to the calculated speed, there may be a little difference from the actual operating speed of the manipulator.
- When the posture angle is specified as the speed, the analog output corresponding to speed is made with respect to the operating speed at the TCP.

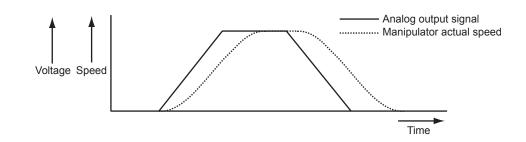

- 6 Convenient Functions
- 6.16 Function of Analog Output Corresponding to Speed

6.16.4 Filtering

In the function of analog output corresponding to speed, the output analog signal can be filtered by setting a filter constant at the parameters.

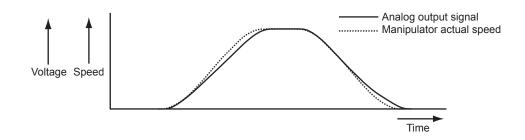

6.16.4.1 When Parameter is Set to "0"

The analog signal according to the speed reference (the speed determined by path calculation) is output.

6.16.4.2 When Parameter is Set to Values Other Than "0"

The analog signal according to the filtered speed reference is output. Filtering makes the output signal close to the manipulator's actual speed.

- 6 Convenient Functions
- 6.16 Function of Analog Output Corresponding to Speed

6.16.4.3 Parameter Setting

Adjust the settings of parameters during actual operations.

Table 6-7: Parameter (Sheet 1 of 2)

Table 6-7: Parameter	(Sheet 2 of 2)
----------------------	---------------	---

The standard parameter settings are as follows:

- For small capacity manipulator (payload of 6 kg or 16 kg) Primary filter constant: 50 msec Secondary filter constant: 50 msec
- For large capacity manipulator (payload of 60 kg or 130 kg) Primary filter constant: 100 msec Secondary filter constant: 100 msec

- 6 Convenient Functions
- 6.16 Function of Analog Output Corresponding to Speed

6.16.5 Notes

6.16.5.1 When Analog Output Corresponding to Speed Is Interrupted

If the manipulator is stopped for some reason and the editing operation is performed, the analog output corresponding to speed is interrupted. This interruption is performed in all output terminals, and the analog voltage immediately before the interruption is output to each output terminal.

The above-mentioned case is the only case where the analog output corresponding to speed is interrupted.

6.16.5.2 When Two or More Manipulators Are Used

The attribute of the job where the instruction is executed determines the manipulator for which the analog output corresponding to speed is performed.

In coordinated interpolation (SMOV[□]), the analog output corresponding to speed is performed with respect to the "relative speed" of the slave-side manipulator to the master-side manipulator.

- 6 Convenient Functions
- 6.17 QR Code Creation Function

6.17 QR Code Creation Function

6.17.1 Outline

By using this QR code creation function, the status of the YRC1000 (system configuration, alarm information, current position data, etc.) can be shown as a QR code on the programming pendant display. The user can use this function to send the current status of YRC1000 to your YASKAWA representative rapidly and accurately when making inquiries or in case an abnormality occurs.

Also, by using an Android application called "MOTOMAN Touch!", the user can send both information (serial number, etc.) read from the QR code of the YRC1000 and information about the status of the YRC1000 read from the programming pendant to your YASKAWA representative. This application provides rapid and correct transmission of information, and thus helps the user to reduce down-time.

	<qr code="" creation="" function=""></qr>
	• While the QR Code Creation function is under function, only following keys and the exclusive keys used for this function are available. (for the key exclusively used for this function, refer to <i>chapter 6.17.5 "Operation Method"</i> .
	[START] [HOLD] [EMERGENCYSTOP] Mode Switch Enable Switch
NOTE	Accordingly, operation of the manipulator in the teaching mode (jog operation) is not available. The manipulator stops its operation if the QR Code Creation function is executed. Do not complete the QR Code Creation function while the axis operation key is being pressed because the operation triggered by the key immediately resumes when the func- tion completes.
	 Even if PLAYBACK OPERATION CONTINUATION FUNC- TION (S2C437=1) is set valid, its window would not appear if the QR Code Creation Function is executed.
	<motoman touch!=""></motoman>
	 Inquire of your YASKAWA representative for downloading method of "MOTOMAN Touch!".
	 "MOTOMAN Touch!" is not designed to avoid failures or reduce the recovery time.

- 6 Convenient Functions
- 6.17 QR Code Creation Function

6.17.2 Main Function

By using the QR code, information of the YRC1000 in the following table can be displayed on the programming pendant.

ltem	Description
QR Code Data	 ALARM (the latest four alarms) ALARM HISTORY (the latest ten alarms for each) MAJOR FAILURE ALARM MINOR FAILURE ALARM USER ALARM (SYSTEM) USER ALARM (USER) OFF-LINE ALARM MONITORING TIME SYS MONITORING TIME SERVO POWER TIME PLAYBACK TIME MOVING TIME OPERATING TIME HOME POSITION CURRENT VALUE SERVO MONITOR Note: Only "ALARM" and "ALARM HISTORY" data are available in the maintenance mode.
Function	 Operations executed by a key Display switch ([FWD] or [BWD]) Completion of the QR Code Creation Function Operations executed by a button on the display Display switch ("Next", "Back", or "First".) Completion of the QR Code Creation Function
QR Code Format	 Format type 10 to 18 (automatically set according to the number of data) Data B-bit byte (binary) Error correction level Level M Maximum number of data in a QR code 560-byte at maximum (when the format type is 18)

- 6 Convenient Functions
- 6.17 QR Code Creation Function

Usage of the QR code by "MOTOMAN Touch!" is as follows.

Item	Description
Reading/Displaying of the YRC1000 serial number, etc.	Read the QR code on the YRC1000 with the smart phone QR code reader, and then displays the serial number, etc.
Reading/Displaying of the status information of the YRC1000	Read the QR code on the programming with the smart phone QR code reader, and then displays the alarm history, etc.
Inquiry	Attach above mentioned QR code data and pictures to an e-mail and send it to the in charge call center. (use the mailer)

"MOTOMAN Touch!" is an application which operates in Android 4.2 or higher environment. However, depending on the manufacturers or type of the smart phone, it may not work.

QR code is a trademark of DENSO WAVE INCORPORATED.

Android is a trademark of Google Inc.

- 2. Select {QR CODE ALL PAGE} from the sub menu.
 - QR Code Creation function starts up and QR codes of the window on which page switching or display switching is available appear. (when ALARM HISTORY is selected, data for the latest ten alarms at each alarm are created)

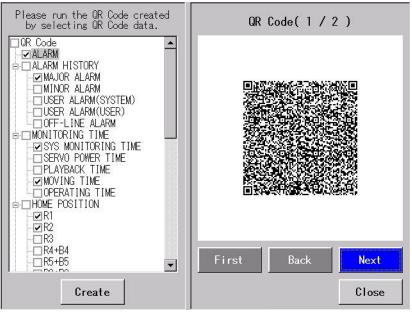

- 6 Convenient Functions
- 6.17 QR Code Creation Function

6.17.4 Display Configuration

The window for the QR Code Creation Function consists of two areas.

- Data for QR code select area
- QR code display area

Data for QR code select area

QR code display area

Displaying status of the button varies depending on the ON/OFF of the button function or the shift of the focusing point.

Example: {Next}

The QR code number and the total number of QR codes are displayed in the QR code display area.

- 6 Convenient Functions
- 6.17 QR Code Creation Function

6.17.5 Operation Method

6.17.5.1 Data for QR Code Select Area

Select data to be codified into a QR code and press {Create} button. A QR code appears.

Use the programming pendant keys or directly touch the display to perform the above-mentioned operation.

When using the programming pendant keys, following keys are usable:

Cursor key

• Shifts the area to be focused.

- [SELECT]
 - When the focus is in the list area of data to be codified into a QR code, selects a data to be codified into the QR code.
 - When the focus is on {Create}, creates a QR code.
- [PAGE]
 - Displays the next QR code (if two or more QR codes are created).
 - Displays the previous QR code by pressing [SHIFT] + [PAGE].
- [AREA]
 - Shifts the area to be focused.
- [CANCEL]
 - Exits the QR Code Creation Function.

- 6 Convenient Functions
- 6.17 QR Code Creation Function

6.17.5.2 QR Code Display Area

A QR code can be displayed, and the CR code to be displayed can be switched.

Use the programming pendant keys or directly touch the display to perform the above-mentioned operation.

When using the programming pendant keys, following keys are usable:

Cursor

• Shifts the area to be focused.

[SELECT]

- When the focus is on {Return}, displays the first QR code.
- When the focus is on {Back}, displays the previous QR code.
- When the focus is on {Next}, displays the next QR code.
- When the focus is on {Close}, exits the QR Code Creation Function.

[PAGE]

- Displays the next QR (if two or more QR codes are created).
- Displays the previous QR code by pressing [SHIFT] + [PAGE].

[AREA]

- Shifts the area to be focused.
- [CANCEL]
 - Exits the QR Code Creation Function.

- 6.17 QR Code Creation Function

6.17.6 QR Code Syntax

6.17.6.1 Basic Syntax

The basic syntax of a QR code is shown below.

- Data header
- System information
- Data 1

When the volume of the data is too large, this function divides the data into several sections before codifying into a QR code.

At this time, the data header and the system information is set to the first data.

• Data header	
System information	
• Data 1	

• Data 2

Data 3

" , (comma)" , " (space)" , and "(new line character)" are used to separate the data.

Data which is not selected in the "Data for QR code select area" will not be codified into the QR code.

- 6 Convenient Functions
- 6.17 QR Code Creation Function

6.17.6.2 Data Header

No.	Item	Syntax	
1	Version	??x.xx	
2	Year, month, date	YYMMDD	
3	Time	HHTT	

Note: "?": any one character, "*": any line, "X": any number

1. Version

Syntax	: "??x.xx"
??	: Version of the controller If the controller is YRC1000, "Y1" is indicated.
X.XX	: Version of the QR Code Creation function (decimal number)
Year, Month, D	Date
Syntax	: "YYMMDD"
YY	: Year when the QR code is created (last two digits)
MM	: Month when the QR code is created
DD	: Date when the QR code is created
Time	
Syntax	: "HHTT"
HH	: Hour when the QR code is created
TT	: Minute when the QR code is created
	?? x.xx Year, Month, E Syntax YY MM DD Time Syntax HH

6.17.6.3 System Information

No.	Item	Syntax	
1	System version	*.X.XX*(*)-XX	
2	Parameter version	XX.XX	
3	Purpose of system	*	

Note: "?": any single character, "*": any line, "X": any number

1. System version

Syntax : "*.x.xx*(*)-xx" System version number displayed on the version window

2. Parameter version

Syntax : "xx.xx"

Parameter version number displayed on the version window

3. Purpose of system

Syntax : " * " Purpose of system displayed on the version window

- 6 Convenient Functions
- 6.18 Time Measuring Function

6.18 Time Measuring Function

6.18.1 Time Measuring Function

Time measuring function measures the execution time for the specified section in the job or the signal output time of the specified signal.

6.18.2 Timer Variable

The result measured by the time measuring function is stored in the timer variable. The contents of the timer variable can be checked in the timer variable window.

To display the timer variable window, select "VARIABLE" and then "TIMER VARIABLE".

TIMER VAR NO.	IABLE CONTENTS	NAME	_
TM0000 TM001 TM002 TM003 TM004 TM005 TM006 TM005 TM006 TM007 TM008 TM009 TM010 TM010 TM011 TM012 TM013			
A	B	C	

* The unit is 0.01 sec. (example: 1.00sec for 100)

* When setting a name to the timer variable which is set to be displayed in the job window, the set name and the time measurement result are displayed in the job window.

A. Move the cursor to a variable number

Move the cursor to any variable number and press [SELECT] to display the numerics input box. After inputting a variable number in the box, press [ENTER]. The cursor moves to the variable number.

B. Edit variable contents

The contents cannot be edited, but can be updated by executing the SETTM instruction.

C. Register a variable name

Move the cursor to the "NAME" of the variable number to be registered and press [SELECT]. The character input line appears. After inputting a variable name, press [ENTER] to register the input variable name.

- 6.18 Time Measuring Function

6.18.3 Time Measuring Method

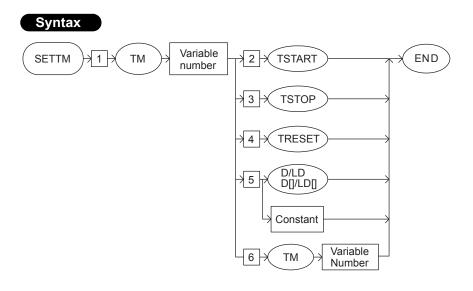

To measure the time, use the SETTM instruction of INFORM instructions.

SETTM

SUBSET	STANDARD	EXPANDED	
Not Available	Available	Available	

Function

Execute these function, such as to start measuring, to end, to reset, and to set the time.

Explanation

1. TM variable number

Add the following tag.

No.	Тад	Explanation	Note
1		Specifies the TM variable number for the	Number: 0 to 59
	number	measurement time writing.	

- 6 Convenient Functions
- 6.18 Time Measuring Function

2. TMSTART/TSTOP/TRESET/D Variable number/LD Variable number/D [Arrangement number]/LD [Arrangement number]/Constant/TM Variable number

Select one of them shown in the table below.

No.	Тад	Explanation	Note
2	TSTART	Specifies to start the time measurement.	
3	TSTOP	Specifies to finish the time measurement.	
4	TRESET	Specifies to reset the time measurement.	
5	D Variable number/ LD Variable number/ D [Arrangement number]/ LD [Arrangement number]/ [Constant]	Specifies the time measurement by the integer type variable.	Number: -2147483648 to 2147483647
6	TM variable number	Specifies the time measurement by timer variable.	Number: 0 to 59

Example

The motion setting of SETTM is shown below.

SETTM SETUP	
TMOOO	
DISPLAY ON JOB CONTENT	ON(LINE1)
TARGET	ELAPSED TIME
	# ****
LOCAL/GLOBAL	LOCAL
ADDITIONAL OUTPUT	NONE
	*** ***

- SETTM TM000 TSTART Starts measuring and sets the measuring time on TM000.
- (2) SETTM TM000 TSTOP Finishes measuring and sets the measuring time on TM000.
- (3) SETTM TM000 TRESET Sets 0 for the measuring time of TM000.
- (4) SETTM TM000 1000 Sets 1000 for the measuring time of TM000, and starts measuring at the same time.
- (5) SETTM TM000 TM001 Sets TM001 for measuring time of TM000, and starts measuring at the same time.

- 6.18 Time Measuring Function

6.18.4 Setting for Time Measurement

For time measurement, set a measuring method for each timer variable. Perform the setting in the SETTM SETUP window.

Display the SETTM SETUP window as follows:

- 1. Set the management mode or higher to the security mode.
- 2. Select "SETUP" under the main menu. Then select "SETTM SETUP".

B	SETTM SETUP TM000 DISPLAY ON JOB CONTE TARGET LOCAL/GLOBAL ADDITIONAL OUTPUT	ENT OFF ELAPSED TIME → # ****** LOCAL NONE **** ****		
			PAGE	

A. Displays a timer variable number whose time measuring method is to be set.

To change the timer variable number, press the [PAGE] key or the PAGE button at the bottom of the window.

B. Sets whether to display the result in the job window.

Select "OFF", "ON(LINE1)", "ON(LINE2)" or "ON(LINE3)". When "ON(LINE1)", "ON(LINE2)" or "ON(LINE3)" is selected, the time measuring result is displayed on the specified line in the auxiliary area of the job window. The same setting cannot be performed for two or more timer variables. For example, while "ON(LINE1)" is set for the timer variable 0, it is changed to "OFF" if "ON(LINE1)" is specified for the timer variable 1.

C. Sets a measuring target.

Select "ELAPSED TIME", "SIGNAL ON TIME" or "SIGNAL OFF TIME". When "ELAPSED TIME" is selected, the time measuring target is the elapsed time in the specified section. When "SIGNAL ON TIME" or "SIGNAL OFF TIME" is selected, the time measuring target is ON or OFF time of the specified signal in the specified section.

D. When the measuring target is "SIGNAL ON TIME" or "SIG-NAL OFF TIME"

Sets a signal number whose time is to be measured when the measuring target is "SIGNAL ON TIME" or "SIGNAL OFF TIME".

E. Selects the time measuring type from "LOCAL" and "GLOBAL".

If "LOCAL" is selected, only the time when the job is executed is measured. If "GLOBAL" is selected, the time when the job is stopped is also measured.

- 6 Convenient Functions
- 6.18 Time Measuring Function

F. Sets an additional output destination where the measuring time is to be output.

Select "NONE", "GENERAL-PURPOSE OUTPUT (2 GROUP)", "GEN-ERAL-PURPOSE OUTPUT (4 GROUP)", "REGISTER (1)" or "REGIS-TER (2)". When "GENERAL-PURPOSE OUTPUT (2 GROUP)", "GENERAL-PURPOSE OUTPUT (4 GROUP)", "REGISTER (1)" or "REGISTER (2)" is selected, the measuring time is set to the specified output destination.

G. Sets a signal number to be output additionally when the additional output target is "GENERAL-PURPOSE OUTPUT 2 GROUP" or "GENERAL-PURPOSE OUTPUT 4 GROUP".

* Example: -32768 to 32767 is output for "GENERAL-PURPOSE OUT-PUT 2 GROUP". Sets a register number to be output additionally when the additional output target is "REGISTER 1" or "REGISTER 2". * Example: As for "REGISTER 1", 0 to 32767 is output when the measuring time is a positive value.

65535 to 32768 is output when the measuring time is a negative value. * When the measuring time is out of the output range, the minimum value or the maximum value of the output range is output.

6.18.5 Displaying Time Measurement Result in Job Window

The time measuring result can be checked in the job window.

Display the time measuring result in the job window as follows:

- 1. Set the management mode or higher to the security mode.
- 2. Select "SETUP" under the main menu. Then select "SETTM SETUP".
- 3. Set "ON(LINE1)", "ON(LINE2)" or "ON(LINE3)" to DISPLAY ON JOB CONTENT in the SETTM SETUP window.

TM000	
DISPLAY ON JOB CONTENT ON(LINE1)	
TARGET ELAPSED TIME	
# ****	
LOCAL/GLOBAL LOCAL	
ADDITIONAL OUTPUT NONE	

- 4. Select {JOB} under the main menu. Then select {JOB CONTENT}.
- 5. Select {DISPLAY} and {TIME MEASUREMENT} in the pull down menu.

6.19.4 Operating the Viewpoint

The procedure for changing the viewpoint is described below.

- 1. From the pull-down menu, select {UTILITY}.
- 2. Select a viewpoint operating method.
- Touch the 3D display area with one finger, and then move the finger up, down, left and right. Touch operations using two fingers or multiple fingers are not

supported.

The types of the viewpoint operation are as follows.

The types of the viewpoint operation are as follows.

Nam	ne	Function		
1	ORBIT	The viewpoint rotates in the direction of the operation performed using a finger.		
2	PAN	The viewpoint moves parallel in the direction of the operation performed using a finger.		
3	ZOOM	The viewpoint zooms in when an upward operation is performed using a finger, and zooms out when a downward operation is performed using a finger.		

The viewpoint operation can be also performed by the key operations. The operation method is as follows.

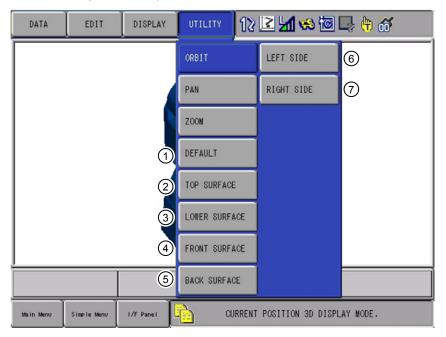

Nam	10	Key operation	
1	ORBIT	[SHIFT] + [CURSOR]	
2	PAN	[CURSOR]	
3	ZOOM	[INTERLOCK] + [CURSOR]	

- 6 Convenient Functions
- 6.19 3D Graphic Display Function

6.19.5 Preset Viewpoint

The preset viewpoint, such as the viewpoint position when starting, the top surface and the side, can be called.

- 1. From the pull-down menu, select {UTILITY}.
- 2. Select the preset viewpoint.

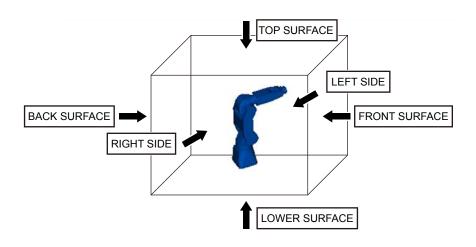

The preset viewpoint and the direction of the viewpoint are as follows.

Nam	ne	Function
1	DEFAULT	Changes to the viewpoint when starting.
2	TOP SURFACE	Changes to the viewpoint observed from above.
3	LOWER SURFACE	Changes to the viewpoint observed from below.
4	FRONT SURFACE	Changes to the viewpoint observed from front.
5	BACK SURFACE	Changes to the viewpoint observed from back.
6	LEFT SIDE	Changes to the viewpoint observed from the left side.
7	RIGHT SIDE	Changes to the viewpoint observed from the right side.

- 6 Convenient Functions
- 6.19 3D Graphic Display Function

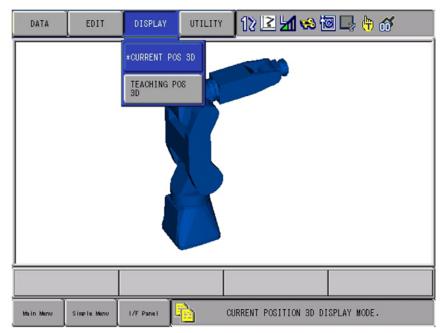

Top surface, lower surface, front surface, back surface, left side and right side are the viewpoints observed from a perpendicular direction from each side of the cuboid defined in the 3D graphic space.

6.19.6 Current Position 3D Display

The current position 3D display mode is described below in this chapter. For changing to the current position 3D display mode, perform the operations in the procedure below.

- 1. From the pull-down menu, select {DISPLAY}.
- 2. Select {CURRENT POS 3D}.
- 3. In the human interface display area, the message "CURRENT POSITION 3D DISPLAY MODE." is displayed.

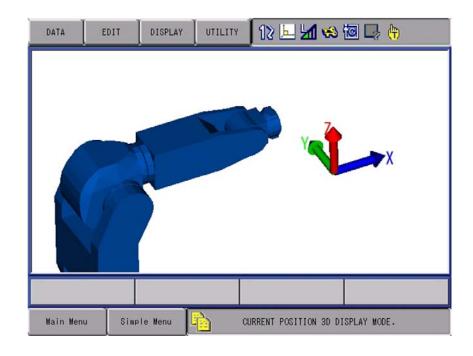

- 6 Convenient Functions
- 6.19 3D Graphic Display Function

6.19.6.1 Display Content

Display During TEACH MODE

In the teach mode, according to the jog operation or the FWD key operation of the robot, the posture of the robot in the 3D display area changes.

When operating by using the cartesian coordinates system, the tool coordinates system, and the user coordinate system, an arrow that indicates the operation direction is displayed. The displayed position is the position (TCP position) considering the selected tool data. The directions of the arrow are the positive direction of the X-axis, the Y-axis, and the Z-axis. The each axis is displayed as follows; X-axis direction is blue, the Y-axis direction is green, and the Z-axis direction is red.

- 6 Convenient Functions
- 6.19 3D Graphic Display Function

Display During PLAY MODE

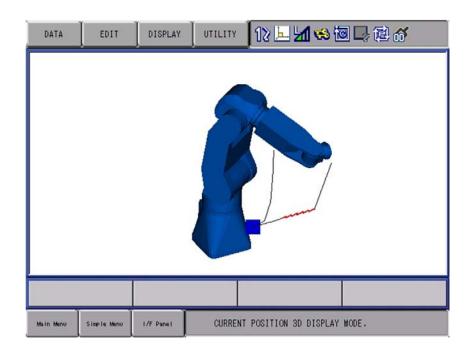

Even in the play mode, in accordance with the motion of the robot, the posture of the robot in the 3D display area changes.

And during playback, the motion path is displayed. The motion path, in the working section, is displayed in different color. When the IO instruction is executed, the icon is changed and displayed.

• The motion path display requires the processing for drawing the information, therefore, the path display is less delayed than the actual motion of the robot.

• Since the path is displayed on the basis of sampling data, depending on the speed, the angular position may not be displayed at the corner.

- 6 Convenient Functions
- 6.19 3D Graphic Display Function

6.19.7 Teaching Position 3D Display

The teaching position 3D display mode is described below in this chapter.

In teaching position 3D display mode, the job teaching position displayed in the job contents is displayed in 3D. When performing the jog operation, the operation will not be reflected to the robot, and the current position will not be displayed.

The teaching position 3D display mode is only valid in the teach mode. And when the mode is changed to the play mode, it is changed to the current position 3D display mode.

For changing to the teaching position 3D display mode, perform the operations in the procedure below.

- 1. From the pull-down menu, select {DISPLAY}.
- 2. Select {TEACHING POS 3D}.
- 3. In the human interface display area, the message "TEACHING POSITION 3D DISPLAY MODE." is displayed.

6.19.8 Functional Safety Range Display

The functional safety range display is described below in this chapter.

For the system which functional safety is valid, the functional safety range is displayed on the 3D display window. The areas that can be displayed are the robot operation limit range and the tool interference. The robot model for the range monitoring is also displayed.

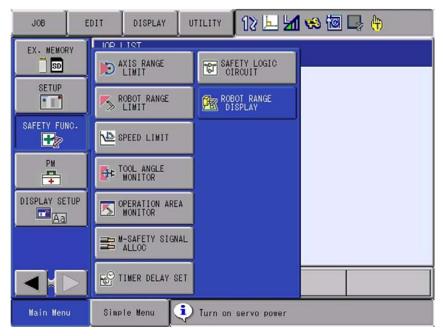

- 6 Convenient Functions
- 6.19 3D Graphic Display Function

6.19.8.1 Display Setting

For setting the display, perform the operations in the procedure below.

- 1. From the menu on the left of the window, select {SAFETY FUNC.}.
- 2. From the sub-menu, select {ROBOT RANGE DISPLAY}.

3. The ROBOT RANGE LIMIT DISPLAY window is displayed.

- 6. The entered settings are reflected in the 3D graphic window.

- 6 Convenient Functions
- 6.20 Remote Pendant Operation Function

6.20 Remote Pendant Operation Function

6.20.1 Overview of the Remote Pendant Operation Function

By using the remote pendant operation function, the display of the programming pendant can be viewed and controlled via a web browser. Thus, the display of the programming pendant can be shown and the status of the YRC1000 can be checked from a remote location. The administrator can set the login name and password of the user who performs the remote pendant operation, and also can set the access method for viewing or operating the programming pendant for each user.

The administrator can register up to 100 user accounts.

Only the administrator can modify the data of a registered user account.

This function is available for YAS1.11-00 or later.

• While the programming pendant is being controlled by the remote pendant operation, the programming pendant cannot be controlled by using the programming pendant itself.

• In the remote pendant operation, the maintenance mode cannot be operated.

6.20.2 Recommended Environment

For security and convenience, we recommend the following web browsers with the latest versions when using the remote pendant operation function.

- Recommended web browsers:
 - Microsoft Internet Explorer 10.0 or later Firefox 6 or later Chrome 4 or later

- 6 Convenient Functions
- 6.20 Remote Pendant Operation Function

6.20.3 Connection with the YRC1000

6.20.3.1 Ethernet Cable Connections

Connect the Ethernet cable (shielded cable: category 5 or higher) to the LAN connector, CN106 (LAN2) or CN107 (LAN3) which are located on the front panel of the ACP01 board inside the CPU rack.

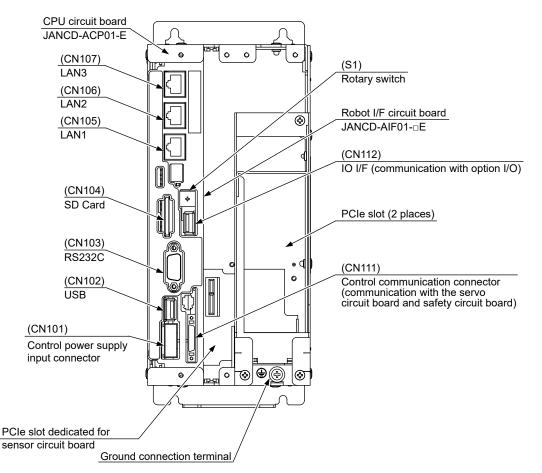

There are three LAN connectors (RJ45) in front of the ACP01 board, and CN106 (LAN2) or CN107 (LAN3) are the connectors for the Ethernet communication function. Do not connect the connector to or disconnect the connector from CN105 (LAN1) since it is exclusively used for the programming pendant.

To the enabled interface (LAN2 or LAN3), the YRC1000 confirms the presence or the type of the connected cable when starting. To avoid performing an unnecessary check process, enable only the interface that is actually connected over an Ethernet cable. Note that LAN3 cannot be enabled by itself. To enable

LAN3, make sure that LAN2 is also enabled.

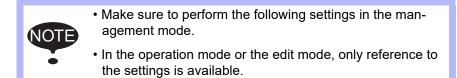

- 6 Convenient Functions
- 6.20 Remote Pendant Operation Function

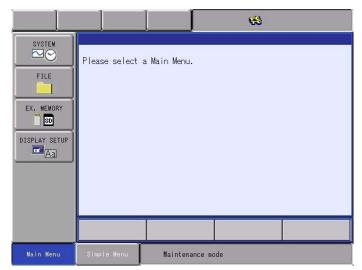

6.20.3.2 LAN Interface Settings

Setting procedure

For performing the data communication by using the Ethernet, first perform the LAN interface settings. These settings are required to use the data communication described in this manual.

- 1. Turn ON the power supply while pressing {Main Menu}.
 - The maintenance mode starts.

2. Set the security mode to the "MANAGEMENT MODE".

6.20.3.3 LAN Interface Setting Items

In the LAN interface settings, perform the following settings.

Host Setting

Select the host name setting method of the YRC1000 from the pull-down menu.

MANUAL SETTING: The character string set in the following item is used as the host name.

DCHP SETTING (LAN2): The host name is acquired from the LAN2 DCHP server.

DCHP SETTING (LAN3): The host name is acquired from the LAN3 DCHP server.

HOST NAME

If "MANUAL SETTING" is set for host setting method, enter the host name by using the character string. Characters which can be used for the host name are half-width

alphanumeric characters, hyphens (-) and underscores (_). Include one or more alphabetic character, and set the name within 32 characters.

Setting the Domain

Select the domain name of the YRC1000 setting method from the pulldown menu.

MANUAL SETTING: The character string set in the following item is used as the domain name.

DCHP SETTING (LAN2): The domain name is acquired from the LAN2 DCHP server.

DCHP SETTING (LAN3): The domain name is acquired from the LAN3 DCHP server.

DOMAIN NAME

If "MANUAL SETTING" is set for domain setting method, enter the domain name by using the character string. Characters which can be used for the domain name are half-width alphanumeric characters, hyphens (-) and underscores (_). Include one or more alphabetic character, and set the name within 32 characters.

IP Address (LAN2)

Select the LAN2 IP address setting method from the pull-down menu.

NOT USED: LAN2 is not used. Thus, LAN3 cannot be used either.

MANUAL SETTING: The value set in the following item is used as the LAN2 IP address/subnet mask.

DCHP SETTING: The IP address (LAN2) is acquired from the DCHP server.

IP ADDRESS

If "MANUAL SETTING" is set for IP address (LAN2) setting method, set the LAN2 IP address to this item. Use half-width numbers and periods (.) for the IP address, and set "xx.xx.xx" using the following format: xx is decimal number from 0 to 255. (Example) 192.168.255.1

6 Convenient Functions

6.20 Remote Pendant Operation Function

YRC1000 supports only IPv4 and does not support IPv6.

[10.0.0.xx] (xx: 0 to 255) cannot be used for the IP address of the LAN2.

• SUBNET MASK

If "MANUAL SETTING" is set for IP address (LAN2) setting method, set the LAN2 subnet mask to this item. Use half-width numbers and periods (.) for the subnet mask, and set "xx.xx.xx" using the following format: xx is decimal number from 0 to 255. (Example) 255.255.255.0

IP Address (LAN3)

Select the LAN3 IP address setting method from the pull-down menu.

NOT USED: LAN3 is not used.

MANUAL SETTING: The value set in the following item is used as the LAN3 IP address/subnet mask.

DCHP SETTING: The IP address (LAN3) is acquired from the DCHP server.

Enable LAN2 before using LAN3.

LAN3 cannot be used without using LAN2.

• IP ADDRESS

If "MANUAL SETTING" is set for IP address (LAN3) setting method, set the LAN3 IP address to this item. Use half-width numbers and periods (.) for the IP address, and set "xx.xx.xx" using the following format: xx is decimal number from 0 to 255. (Example) 172.16.0.1

YRC1000 supports only IPv4, does not support IPv6.

[10.0.0.xx] (xx: 0 to 255) and the address of the same network as LAN2 cannot be used for the IP address of LAN3.

SUBNET MASK

If "MANUAL SETTING" is set for IP address (LAN3) setting method, set the LAN3 subnet mask to this item. Use half-width numbers and periods (.) for the subnet mask, and set "xx.xx.xx" using the following format: xx is decimal number from 0 to 255. (Example) 255.255.255.0

6 Convenient Functions

6.20 Remote Pendant Operation Function

Default Gateway

Select the default gateway of the YRC1000 setting method from the pull-down menu.

NOT USED: The default gateway is not used.

- MANUAL SETTING: The value set in the following item is used as the default gateway.
- DCHP SETTING (LAN2): The default gateway is acquired from the LAN2 DCHP server.

DCHP SETTING (LAN3): The default gateway is acquired from the LAN3 DCHP server.

• DEFAULT GATEWAY

If "MANUAL SETTING" is set for default gateway setting method, set the default gateway to this item. Use half-width numbers and periods (.) for the default gateway, and set "xx.xx.xx" using the following format: xx is decimal number from 0 to 255. (Example) 192.168.255.200

Static Route (LAN2)

Select whether to perform the static route control via LAN2 from the pulldown menu.

NOT USED: The static route control via LAN2 is not performed.

MANUAL SETTING: Perform the static route control using the value set in the following item.

NETWORK DESTINATION

If "MANUAL SETTING" is set for static route (LAN2) setting method, set the network destination to perform static route control via LAN2 to this item. Use half-width numbers and periods (.) for the network destination, and set "xx.xx.xx" using the following format: xx is decimal number from 0 to 255.

SUBNET MASK

If "MANUAL SETTING" is set for static route (LAN2) setting method, set the subnet mask to perform static route control via LAN2 to this item. Use half-width numbers and periods (.) for the subnet mask, and set "xx.xx.xx.xx" using the following format: xx is decimal number from 0 to 255.

• GATEWAY

If "MANUAL SETTING" is set for static route (LAN2) setting method, set the gateway to perform static route control via LAN2 to this item. Use half-width numbers and periods (.) for the gateway, and set "xx.xx.xx" using the following format: xx is decimal number from 0 to 255.

- 6 Convenient Functions
- 6.20 Remote Pendant Operation Function

Static Route (LAN3)

Select whether to perform the static route control via LAN3 from the pulldown menu.

NOT USED: The static route control via LAN3 is not performed.

MANUAL SETTING: Perform the static route control using the value set in the following item.

NETWORK DESTINATION

If "MANUAL SETTING" is set for static route (LAN3) setting method, set the network destination to perform static route control via LAN3 to this item. Use half-width numbers and periods (.) for the network destination, and set "xx.xx.xx" using the following format: xx is decimal number from 0 to 255.

SUBNET MASK

If "MANUAL SETTING" is set for static route (LAN3) setting method, set the subnet mask to perform static route control via LAN3 to this item. Use half-width numbers and periods (.) for the subnet mask, and set "xx.xx.xx.xx" using the following format: xx is decimal number from 0 to 255.

GATEWAY

If "MANUAL SETTING" is set for static route (LAN3) setting method, set the gateway to perform static route control via LAN3 to this item. Use half-width numbers and periods (.) for the gateway, and set "xx.xx.xx" using the following format: xx is decimal number from 0 to 255.

DNS Setting

For using the DNS (Domain Name System) client function, and for the setting method of DNS server when using the DNS client function, select from the pull-down menu.

NOT USED: The DNS is not used.

MANUAL SETTING: The value set in the following item is used as the DNS server.

DCHP SETTING (LAN2): The DNS Server is acquired from the LAN2 DCHP server.

DCHP SETTING (LAN3): The DNS Server is acquired from the LAN3 DCHP server.

DNS SERVER

If "MANUAL SETTING" is set for DNS setting method, set the IP address of the DNS server to this item. Use half-width numbers and periods (.) for the IP address of the DNS server, and set "xx.xx.xx" using the following format: xx is decimal number from 0 to 255.

- 6 Convenient Functions
- 6.20 Remote Pendant Operation Function

SNTP Setting

For using the SNTP (Simple Network Time Protocol) client function, and for the setting method of SNTP server when using the SNTP client function, select from the pull-down menu.

NOT USED: The SNTP is not used.

- MANUAL SETTING: The value set in the following item is used as the SNTP server.
- DCHP SETTING (LAN2): The SNTP Server is acquired from the LAN2 DCHP server.
- DCHP SETTING (LAN3): The SNTP Server is acquired from the LAN3 DCHP server.
 - SNTP SERVER

If "MANUAL SETTING" is set for SNTP setting method, set the SNTP setting to this item. Use half-width numbers and periods (.) for the SNTP server IP address, and set "xx.xx.xx" using the following format: xx is decimal number from 0 to 255. Note that if the DNS client function is enabled, the FQDN (Fully Qualified Domain Name: "Hostname@domainname" name format) can also be set. Characters which can be used for the FQDN are half-width alphanumeric characters, hyphens (-), underscores (_) and the at-sign (@) which is the character boundary between the

TIME DIFFERENCE FROM UTC The time that can be acquired by using SNTP is UTC (Coordinated Universal Time). To calculate the local time from UTC, enter the time difference between UTC and the local time. Every time a symbol is selected, "+" and "-" switches. Enter halfwidth numeric characters for each hour and minute. The settable range is from -12:00 to +14:00.
INQUIRY INTERVAL (H)

host name and the domain name. Set it within 128 characters.

Enter a time interval for making an inquiry to the SNTP server. Enter the hour (H) using half-width numeric characters. The settable range is 10 to 99.

- 6 Convenient Functions
- 6.21 High Accuracy Path Control Function

6.21 High Accuracy Path Control Function

6.21.1 Description of High Accuracy Path Control Function

The high accuracy path control function allows the motion path of the manipulator to be with high accuracy by moving the motion path of the manipulator to the command path closer.

This function is available in YAS1.35-00 or later.

Using this function, the path difference during the linear interpolation or the inward-turning amount during the circular interpolation is reduced.

The operation command speed slows down automatically to reproduce the operation-command trajectory more faithfully during the circular interpolation. The operation command speed is adjusted automatically, therefore, the adjustment of the teaching speed does not have to be done while confirming the path and the teaching work can be reduced.

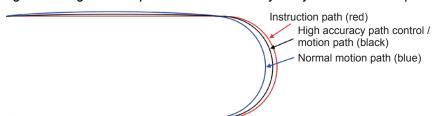

Fig. 6-8: Image of the operation-command trajectory and the motion path

Using this function, the operation of the manipulator may vibrate depending on the teaching position or the teaching speed.

Correct the teaching position and the teaching speed when the operation of the manipulator vibrates. Or disable the high accuracy path control function.

Using this function, the shock sensor may occur. When the shock sensor occurs, change the shock sensor level.

For details, refer to chapter 8.7 Shock Detection Function in YRC1000 INSTRUCTIONS (RE-CTO-A221).

6.21.2 Instruction of High Accuracy Path Control Function

The instructions, HTRAJON and HTRAJOF, are used for the function of the high accuracy path control.

The high accuracy path control will be valid in the operation of the area between the HTRAJON instruction and the HTRAJOF instruction.

The high accuracy path control function can be used for the manipulator.

Use the high accuracy path control in the operating area where the highly accurate path is required.

- 6 Convenient Functions
- 6.21 High Accuracy Path Control Function

HTRAJON Instruction

This is the instruction to enable the high accuracy path control.

This instruction is applied during the playback or test operation, not during the axis operation.

The additional items of the HTRAJON instruction are shown below.

① Select robot

Select the robot to apply the high accuracy path control. If omitted, this instruction is enabled to the robot specified by the JOB control group.

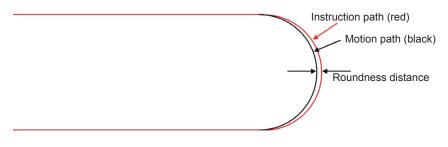

② Roundness Distance Specification

When the circular interpolation operation (or the consecutive MOVC instruction) is in the high accuracy path control area, the amount of inward turning operation (=roundness distance) of the motion path for the manipulator to the circular interpolation operation can be specified.

Unit: 0.001 mm

This specification can be omitted. If omitted, the roundness distant specification will be operated in the default value, 0.5 mm.

Fig. 6-9: Roundness Distance

- 6 Convenient Functions
- 6.21 High Accuracy Path Control Function

HTRAJOF Instruction

This is the instruction to end the high accuracy path control.

① Select robot

SUPPLE

Select the robot to end the high accuracy path control.

In the high accuracy path control area which is between the HTRAJON instruction and the HTRAJOF instruction, the positioning zone (PL) can be used at the circular interpolation operation (the consecutive MOVC instruction) or the different kind of steps for the interpolation instruction.

* The consecutive circular interpolation (MOVC instruction) is corresponding to only when PL=0.

For details of the positioning zone, refer to chapter 8.2.0.8 "S1CxG033 to S1CxG040: POSITIONING ZONE".

6.21.3 Instruction Registration of High Accuracy Path Control Function

When the cursor is in the address area, the instruction can be registered by using the JOB CONTENT window. Perform following operations before registering the instruction.

- 1. Select {JOB} under the main menu.
- 2. Select {JOB CONTENT}.
- 3. Move the cursor to the address area.

- 6 Convenient Functions
- 6.22 Speed Priority Control Function

6.22 Speed Priority Control Function

6.22.1 Speed Priority Control Function

Speed priority control function enables the manipulator to move at the specified speed even when the distance between teaching positions is short.

This function is available in YAS4.24-00 or later.

When the distance between teaching positions is short, the manipulator may move at the slower speed than the specified speed as shown in the figure due to the required distance is not enough to reach the specified speed.

By using the speed priority control function, the manipulator moves at the specified speed, as shown in the figure, even when the distance between teaching positions is short.

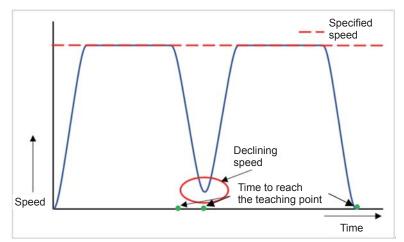

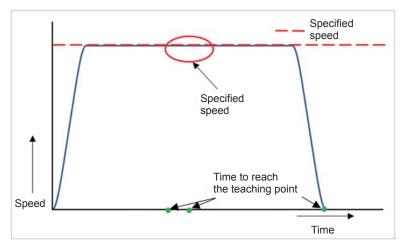

Fig. 6-11: Operating Speed When Using the Speed Priority Control Function

6 Convenient Functions

6.22 Speed Priority Control Function

This function moves the manipulator at the speed priority, therefore, the manipulator may vibrate.

When the manipulator vibrates, set the move instruction to ACC (acceleration adjustment ratio) or DEC (deceleration adjustment ratio), or review the teaching speed.

This function may not make the teaching motion speed reach the specified speed.

When the motion speed does not reach the specified speed, review the posture or the motion speed of the manipulator.

This function makes the manipulator move at the forcibly specified speed.

When using this function, set only the required range to the speed priority control range.

6.22.2 Instruction

6.22.2.1 Instruction of the Speed Priority Control Function

The instructions, HPVELON and HPVELOF are used for the function of the speed priority control.

HPVELON Instruction

This is the instruction to start the speed priority control.

This instruction is executed only at the playback or the test operation, not executed during the axis operation.

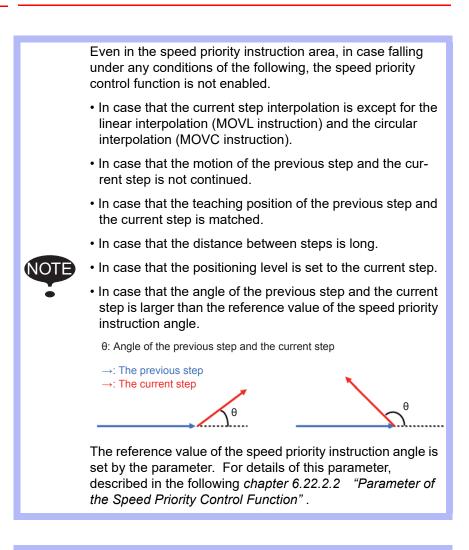

HPVELON

HPVELOF Instruction

This is the instruction to end the speed priority control.

HPVELOF

- 6 Convenient Functions
- 6.22 Speed Priority Control Function

This function affects the step motion of the outer range, therefore, the speed priority control function is not enabled at the right after the step of the HPVELON instruction and the right before the step of the HPVELOF instruction.

6.22.2.2 Parameter of the Speed Priority Control Function

The reference value of the speed priority instruction angle is set by the following parameter.

S3C	Details
	Reference value of the speed priority instruction angle (Unit: 0.1 degrees) 0 (initial setting value): 25.0 degrees

- 6 Convenient Functions
- 6.22 Speed Priority Control Function

6.22.2.3 Registration of the Instruction of the Speed Priority Control Function

When the cursor is in the address area, the instruction can be registered by using the JOB CONTENT window. Perform following operations before registering the instruction.

- 1. Select {JOB} under the main menu.
- 2. Select {JOB CONTENT}.
- 3. Move the cursor to the address area.

- 6 Convenient Functions
- 6.22 Speed Priority Control Function

6.22.3 Example

6.22.3.1 Motion Example of the Speed Priority Control

JOB examples to use the speed priority control function are shown below.

Line	Instruction	
0000	NOP	
0001	MOVJ VJ=10.00	
0002	MOVL V=320.0	
0003	HPVELON	: Speed priority control function starts.
0004	MOVL V=320.0	: ①
0005	MOVL V=320.0	
0006	MOVL V=320.0	
0007	MOVL V=320.0	: ②
8000	MOVL V=320.0	
0009	MOVL V=320.0	: ③
0010	MOVL V=320.0	: ④
0011	MOVL V=320.0	
0012	HPVELOF	: Speed priority control function ends.
0013	MOVJ VJ=10.00	
0014	END	

When the manipulator moves at the slower speed than the specified speed due to the distance to the teaching position such as the motion instruction 1 to 4 is short, the motion can be executed at the specified constant speed.

- 6 Convenient Functions
- 6.23 Alarm Contents Customize Function

6.23 Alarm Contents Customize Function

With the alarm contents customize function, the user alarm file (CSV file) created and registered by the user is displayed on the alarm contents window when the user alarm (8000s) and the user I/O alarm (9000s) occurs.

This function is available for YAS2.55-00 or later.

Operation procedures (overview) are described in this chapter.

- Save the default user alarm file to the external device from the alarm contents customize window.
- Edit the user alarm file on PC.
- Load the user alarm file to the programming pendant from the alarm contents customize window.

6.23.1 Alarm Contents Customize Window

- 1. Set the security to the management mode or higher.
- Select {SYSTEM INFO} {ALM CONT. CUSTOMIZE} under the main menu.

	CLOSE					

The Alarm Contents Customize window appears.

- 6 Convenient Functions
- 6.23 Alarm Contents Customize Function
- 3. Perform loading and saving operations of the user alarm file on the Alarm Contents Customize window.
 - External Device Selection Select either "SD:Pendant" or "USB:Pendant" from the pull-down menu. ("SD:Pendant" is set by default.) Processing is performed for the selected device.
 - User Alarm File Selection Select a user alarm file to load and save.
 (All files are checked and enabled by default.) If no files are checked, they will be disabled and an error will be displayed.
 - LOAD

Load the targeted user alarm file to the programming pendant from the external device.

User alarm files of all the languages stored in the external device are all saved.

If a user alarm file is not stored in the programming pendant, save the default user alarm file.

CLOSE

Close the alarm contents customize window.

- 6 Convenient Functions
- 6.23 Alarm Contents Customize Function

6.23.2 Storage Location of the User Alarm File of the External Device

When loading a user alarm file, correctly set the folder configuration and the file storage location of the external device.

Storage Card / USB Memory

AlarmContentsCustomize	Storage folder of the user alarm file

6.23.3 Rules for Creating User Alarm File (CSV File)

Create the user alarm file according to the following rules.

- Edit with a text editor.
- Use a comma (,) for delimiter between items.
- When using a double quotation mark (") as a character, write two consecutive double quotations.
- When using a comma (,) as contents of the item, enclose the corresponding entire characters in double quotations.
- If the number of characters used for the contents of Cause increase, insert a line feed code.
- Do not use '0' in the sub code.
- It is also possible not to specify a sub code value.
- To set multiple sub codes for one alarm, write to multiple lines.
- When setting multiple sub codes for one alarm, the data for setting the sub code value and the data without setting the sub code value cannot be mixed.
- When setting multiple sub codes for one alarm code, set "Alarm Number", "Alarm Name/Message", and "Contents" only for the first data.
- Insert a line feed code at the end of each data.
- When "Notes" of the last data has multiple lines, enclose the entire characters for Notes in double quotations.

- 6 **Convenient Functions**
- 6.23 Alarm Contents Customize Function

6.23.4 Error Code List of the Alarm Detail Window

If the user alarm file is not set correctly, the error message and the error code will be displayed when the ALARM DETAIL window appears.

Set the user alarm file correctly in this case.

- 6 Convenient Functions
- 6.25 Job Security Function

6.25 Job Security Function

The job security function allows a password to be set for each target job so that created jobs cannot be easily distributed to other controllers.

This function is available for YAS3.03-00 or later.

This function can be set and changed when the security mode is management mode or higher.

Example Usage: Selling a Job Created by a System Integrator

Each target job can be managed by setting password information (4 to 16 half-width alphanumeric characters) for the following three types of security settings.

- · Display/hide job contents
- · Execute job after loading
- · Permit/prohibit job saving

Parameter	Details and Setting Values	Default Value
S2C1560	Shows or hides the permit save setting item. 0: Hide the permit save setting item. 1: Show the permit save setting item.	0

The loss of jobs can be prevented by managing jobs with passwords to hide the contents of jobs, to prevent jobs from being executed on other controllers after loading, and to prevent saving jobs to external memory devices.

The security settings ("CONTENTS DISPLAY", "EXECUTE JOB (After a Load)", and PERMIT/PROHIBIT for "SAVE JOB") can be set for jobs, macro jobs, and system jobs. However, the security settings cannot be set for the job edit function during playback.

6.25.1 Prohibiting the Display of Job Contents

You can prohibit displaying the contents of each job in order to hide the contents of those jobs. For a job with "CONTENTS DISPLAY" set to "PROHIBIT", all instructions on the JOB CONTENT window are displayed as "Invisible" except for the NOP and END instructions.

For a job with "CONTENTS DISPLAY" set to "PROHIBIT", only the job name and control group are displayed.

Job with "CONTENTS DISPLAY" Set to "PROHIBIT"

The following operations are restricted for jobs with "CONTENTS DISPLAY" set to "PROHIBIT".

- The job cannot be edited (adding, changing, and deleting instructions).
- The job cannot be deleted, renamed, or copied.
- The contents of instructions cannot be displayed with direct open.
- The command position are not displayed on the COMMAND POSI-TION window.
- The job cannot be set as a target for conversion.
- Job operations cannot be performed during playback.
- All display colors are reset. (All items are displayed in black.)
- The step number and tool of subtitles are all displayed as "*".
- The UNDO and REDO functions cannot be used.
- Search, copy, cut, paste and reverse paste cannot be used.

- 6 Convenient Functions
- 6.25 Job Security Function

On the JOB HEADER window for each job, set "CONTENTS DISPLAY" to "PERMIT" or "PROHIBIT".

- 1. Select {JOB} under the main menu.
- 2. Select {JOB}.

Jobs with "CONTENTS DISPLAY" set to "PROHIBIT" cannot be edited.

Operations that change the contents of jobs during playback execution, such as changing the speed of move instructions with speed override, can change the contents of jobs even if "CONTENTS DISPLAY" is set to "PROHIBIT". (For information on speed override, refer to *chapter 4.4*

"Modifying Play Speed".) To prohibit changing a job during playback execution, set "EDIT LOCK" to "ON". (To prohibit editing of jobs, refer to chapter 5.6 *"Setting Edit Lock on Individual Job Units"*.)

To prohibit saving jobs with "CONTENTS DISPLAY" set to "PROHIBIT" to an external memory device, set "SAVE JOB" to "PROHIBIT". For the setting to prohibit saving a job, refer to *chapter 6.25.3 "Prohibiting Saving a Job"*.

- 6 Convenient Functions
- 6.25 Job Security Function

6.25.2 Prohibiting Job Execution after Loading

To prohibit created jobs from being executed after being loaded on other controllers, you can set "EXECUTE JOB (After a Load)" to "PROHIBIT" for each job. For a job with "EXECUTE JOB (After a Load)" set to "PROHIBIT", the job does not appear on the JOB LIST window after it is loaded on another controller. Instead, it appears on the SECURITY JOB LIST window.

To execute a prohibited job, you must enter the registered password on the SECURITY JOB LIST window and change the setting from "PROHIBIT" to "PERMIT".

On the JOB HEADER window for each job, set "EXECUTE JOB (After a Load)" to "PERMIT" or "PROHIBIT".

- 1. Select {JOB} under the main menu.
- 2. Select {JOB}.

6.25.6 Saving/Loading/Verifying Jobs

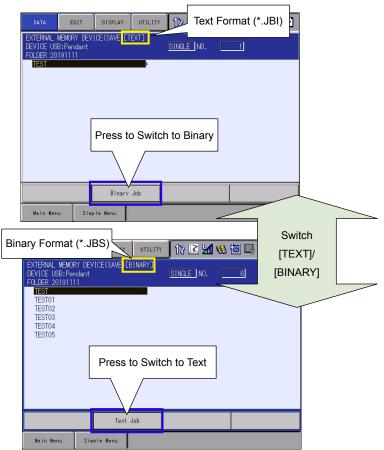

Jobs with "CONTENTS DISPLAY" set to "PROHIBIT" are output as security jobs in a binary format so that the contents cannot be understood from the format output to an external memory device.

On the SAVE/LOAD windows of the external memory device menu, switch between the text format (JBI) and binary format (JBS) with the function key.

JBS: Security job (binary format)

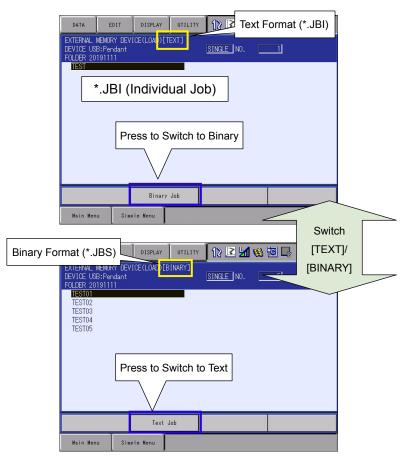

Verification cannot be performed on jobs set with security (JBS).

SAVE Window

6 Convenient Functions

- 6.25 Job Security Function
 - LOAD Window

- 6 Convenient Functions
- 6.26 Multi-Move Function

6.26 Multi-Move Function

6.26.1 Multi-Move Function

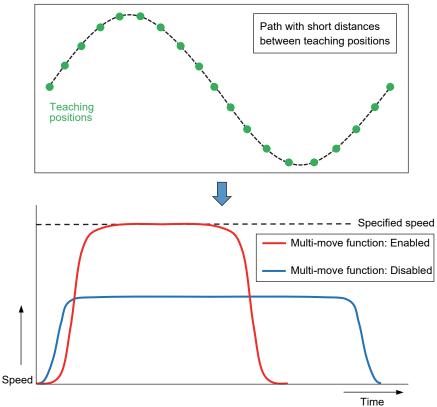

The multi-move function is a new acceleration/deceleration control function that can generate an acceleration/deceleration pattern spanning multiple steps.

This function is available in YAS2.82-00 or later.

When the distance between teaching positions is short, the manipulator may operate at a slower speed than the specified speed. This happens because the necessary distance to reach the specified speed is insufficient.

By using the multi-move function, the manipulator moves at the specified speed, as shown in the figure, even when the distance between teaching positions is short.

6 Convenient Functions

6.26 Multi-Move Function

The following restrictions apply when using the multi-move function. • This function can be applied to move instructions in jobs with the R1 control group only (This function cannot be applied to move instructions in coordinated jobs). • This function can be applied to the MOVL and IMOV move instructions only. • This function can be used with the following instructions inside a multi-move section only. DOUT, DIN, PULSE, CALL (no conditions specified), JUMP (no conditions specified), LABEL, COMMENT, INC, DEC, SET, ADD, SUB, MUL, DIV, SQRT, SIN, COS, ATAN, MULMAT, INVMAT, SFTON, and SFTOF • If the VMAX, CR, PD, or PL tag is added to a move instruction in the multi-move section and VMAX, CR, PD, or PL \neq 0, alarm "4295 HPMMV CTRL FAILED" will occur.

This function may cause the manipulator to vibrate, depending on the teaching position or teaching speed.

When the manipulator vibrates, set ACC = (acceleration adjustment ratio) or DEC = (deceleration adjustment ratio) to the HPMMVON instruction, or review the teaching speed.

- 6 Convenient Functions
- 6.26 Multi-Move Function

6.26.2 Instructions

6.26.2.1 Instructions of the Multi-Move Function

The instructions HPMMVON and HPMMVOF are used for the multi-move function.

HPMMVON Instruction

This is the instruction to start the multi-move operation.

This instruction is executed only at the playback or the test operation. It is not executed during the axis operation.

Additional items for the HPMMVON instruction are as follows:

OControl speed

Specify the control point speed in the multi-move section. When this speed is specified, the speed specified by the move instruction in the multi-move section will be ignored. In the same manner, the speed specified by the SPEED instruction will also be ignored. Specify the speed unit on the OPERATE CONDITION SETTING window.

②Acceleration adjustment ratio: 20% to 100%

Specify the acceleration adjustment ratio.

The acceleration adjustment ratio controls the acceleration slope at the specified ratio of normal acceleration.

³Deceleration adjustment ratio: 20% to 100%

Specify the deceleration adjustment ratio.

The deceleration adjustment ratio controls the deceleration slope at the specified ratio of normal deceleration.

④Degree of approximation: 50% to 100%

Specify the degree of approximation.

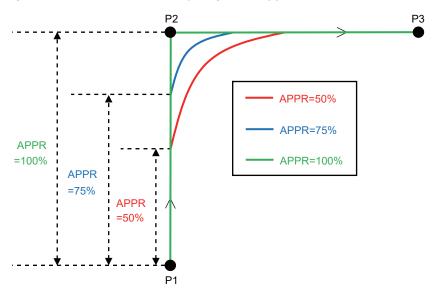

The degree of approximation represents how close the manipulator passes through the teaching position.

As shown in the figure, when 100% is specified, the manipulator completely reaches the target position. When 50% is specified, the manipulator approaches halfway between the start position of the move instruction and the target position.

When the degree of approximation is specified, if PL=0 is added to the move instruction in the multi-move section, alarm "4295 HPMMV CTRL FAILED" will occur.

- 6 Convenient Functions
- 6.26 Multi-Move Function

HPMMVOF Instruction

This is the instruction to end the multi-move operation.

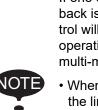

HPMMVOF

	If any of the following conditions is satisfied, even when the manipulator is in a multi-move section, the multi-move sec- tion is canceled at that path and restarted from the next path.
	 When the teaching position for the previous step and cur- rent step are the same.
	 When it is determined that torque saturation of any axis will occur by executing multi-move operation.
NOTE	 When the angle between the previous step and current step is larger than the reference value of the multi-move instruction angle.
	Angle between the previous step and current step $\boldsymbol{\theta}$
	$\rightarrow : \text{Previous step} \\ \rightarrow : \text{Current step} \\ \theta \\ $
	The reference value of the multi-move angle is set by the parameter. Details on this parameter are described in chapter 6.26.3 <i>"Parameter of the Multi-Move Function"</i> .

- 6 Convenient Functions
- 6.26 Multi-Move Function

The manipulator control method differs before and after the HPMMVON instruction. For this reason, the manipulator first decelerates due to normal control in the step immediately before HPMMVON, and then it accelerates due to multi-move control in the step immediately after HPMMVOF. In the same manner, the manipulator first decelerates due to multi-move control in the step immediately before HPM-MVOF, and then it accelerates due to normal control in the step immediately after HPMMVOF.

- If one of the following operations is performed after playback is stopped in the multi-move section, multi-move control will be canceled when operation is restarted and operation will restart in normal control. In all other cases, multi-move control will continue.
- When the cursor is moved by an operation that changes the line number, etc., on the programming pendant when the manipulator is stopped.
- When another job is called.
- When an edit (add, modify, delete) operation is performed using the programming pendant.

6.26.3 Parameter of the Multi-Move Function

The reference value of the multi-move angle is set by the following parameter.

S3C	Details
1405	Reference value of the multi-move angle (Unit: 0.1 degrees) 0 (initial setting value): 25.0 degrees

6.26.4 Specific Output Signals During Multi-Move Operation

During multi-move operation, the following specific output signals are turned ON for each control group (manipulator). When operation is stopped, the specific output signals are turned OFF.

0008 MOVL V=500.0
0009 END

HPMMVON Instruction

1. Move the cursor to one line above the place to register HPMMVON.

0000	NOP	
0001	MOVJ	VJ=50.00
0002	MOVE	V=500.0

- 2. Press [INFORM LIST].
- 3. Select {OTHER}.
- 4. Select {HPMMVON}.
 - The HPMMVON instruction is displayed in the input buffer line.

HPMMVON V=500.0

Change the numeric value of V at this time to adjust the speed in the section.

- 5. Press [INSERT] and [ENTER].
 - The HPMMVON instruction is registered.

- 6 Convenient Functions
- 6.26 Multi-Move Function

HPMMVOF Instruction

1. Move the cursor to one line above the place to register the HPMMVOF instruction.

```
0008 MOVL V=500.0
0009 MOVL V=500.0
0010 END
```

- 2. Press [INFORM LIST].
- 3. Select {OTHER}.
- 4. Select {HPMMVOF}.
 - The HPMMVOF instruction is displayed in the input buffer line.

HPMMVOF

- 5. Press [INSERT] and [ENTER].
 - The HPMMVOF instruction is registered.

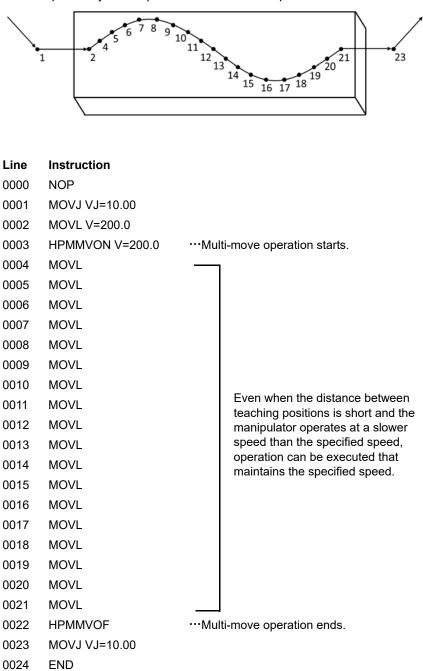

6 Convenient Functions

6.26 Multi-Move Function

6.26.6 Motion Example of the Multi-Move

An example of a job that performs multi-move operation is shown below.

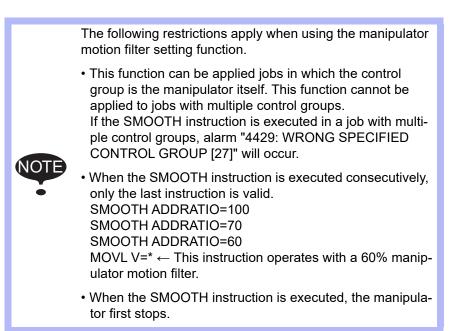

- 6 Convenient Functions
- 6.27 Manipulator Motion Filter Setting Function

6.27 Manipulator Motion Filter Setting Function

6.27.1 Outline

When the manipulator vibrates, using this function to set the manipulator motion filter can make the manipulator move smoothly and reduce vibrations.

This function is available in YAS4.13-00 or later.

If one of the following operations is performed after playback is stopped in the manipulator motion filter setting section, the manipulator motion filter that was set will be disabled when operation is restarted. In all other cases, the manipulator motion filter that was set will be maintained.

- When the cursor is moved by an operation that changes the line number, etc., on the programming pendant when the manipulator is stopped.
- When another job is called.
- When an edit operation is performed (add, modify, delete) using the programming pendant.

This function will increase the inward-turning amount, depending on the teaching position or teaching speed.

For this reason, always check the operating path of the manipulator after the function is applied.

- 6 Convenient Functions
- 6.27 Manipulator Motion Filter Setting Function

6.27.2 Instructions

6.27.2.1 Instructions of the Manipulator Motion Filter Setting Function

This function uses the SMOOTH instruction to specify the move instruction section for which the manipulator motion filter will be set and the manipulator motion filter ratio.

If the ADDRATIO=*** tag (*** is the motion filter ratio) is added to the SMOOTH instruction, the manipulator motion filter with the ratio specified by *** is applied from the motion by subsequent move instructions.

To end the application of the manipulator motion filter, add the NEUTRAL tag to the SMOOTH instruction.

SMOOTH ADDRATIO=

This is the instruction to start the application of the manipulator motion filter.

SMOOTH ADDRATIO=100

OManipulator motion filter ratio

Specify the manipulator motion filter ratio to apply (setting range: 0% to 300%).

SMOOTH NEUTRAL

This is the instruction to end the application of the manipulator motion filter.

6.27.3 Parameters of the Manipulator Motion Filter Setting Function

The manipulator motion filter setting function is enabled or disabled by the following parameter.

S2C	Details
1596	Enable manipulator motion filter setting function 0: Disable 1: Enable

The setting value when the manipulator motion filter ratio is 100% can be changed with the following parameters (when the initial value is "0", the setting value is automatically calculated for each model).

S1CxG	Details
	Filter setting value for the manipulator motion filter setting function
1529	0: Manufacturer setting value (automatically calculated for each model) Other than 0: Applies the setting value.

- 6 **Convenient Functions**
- Manipulator Motion Filter Setting Function 6.27

6.27.4 Registration of the Instruction of the Manipulator Motion Filter Setting Function

Registration of the SMOOTH Instruction

- 1. Move the cursor to one line above the place to register the instruction.
- 2. Press [INFORM LIST].
- 3. Select {OTHER}.
- 4. Select {SMOOTH}.
 - The SMOOTH instruction is displayed in the input buffer line.

- 5. Select the SMOOTH instruction displayed on the input buffer line and open the detailed settings window.
 - Select the "ADDRATIO=" or "NEUTRAL" tag to enable or disable the instruction.

- 6. Press [INSERT] and [ENTER].
 - The SMOOTH instruction is registered.

- 1		
	0000	NOP
	0001	SMOOTH ADDRATIO=100
	0002	MOVL V=1500
		LIGHT IL ATTAC

6.27.5 Example of Job Using the Manipulator Motion Filter Setting Function

Line	Instruction		
0000	NOP		
0001	MOVJ VJ=10.00		
0002	MOVL V=200.0		
0003	SMOOTH ADDRATIO=100	···Set	t manipulator motion filter (100%).
0004	MOVL V=200.0		
0005	MOVL V=200.0		
0006	MOVL V=200.0		These instructions operate with
0018	MOVL V=200.0		the manipulator motion filter set by the SMOOTH instruction
0019	MOVL V=200.0		(100%).
0020	MOVL V=200.0		
0021	MOVL V=200.0		
0022	SMOOTH NEUTRAL	···Ca	ncel manipulator motion filter.
0023	MOVJ VJ=10.00		
0024	END		

- 7 External Memory Device
- 7.1 Memory Device

7 External Memory Device

7.1 Memory Device

The following memory devices can be used in the YRC1000 to save and load data such as jobs and parameters.

Device	Function	Media (destination of saved/loaded data)	Optional function requirement
SD: Pendant	Standard	SD card	No requirement. Programming pendant is equipped with a slot.
USB: Pendant	Standard	USB memory stick	No requirement. Programming pendant is equipped with a connector.
FC1 (YRC)	Optional ¹⁾	Personal computer (FC1 emulator)	Personal computer with "FC1 emulator"
PC	Optional ¹⁾	Personal computer (MOTOCOM32 host)	Via RS-232C: "Data transmission function" and "MOTOCOM32" Via Ethernet: "Ethernet function" plus above two requirements
FTP	Optional ¹⁾	FTP server such as personal computer	"Data transmission function", "MOTOCOM32", and "FTP function"
USB1: Controller	Standard	USB memory stick	No requirement. CPU board (JANCD-ACP01) is equipped with a connector.

1 For the operation, refer to instruction manuals for each optional function.

- 7 External Memory Device
- 7.1 Memory Device

7.1.1 SD Card

SD cards can be used as media for external storage.

When using an SD card as an external storage device, insert it into the programming pendant's internal SD card slot.

The SD card must meet the following requirements.

File system: Formatted in FAT16 or FAT32.

Capacity standard: SD, SDHC, or SDXC.

NOTE	If an SD card with a file system other than FAT16, FAT32, or exFAT is used for the programming pendant, automatic for- matting will be performed and the data stored on the SD card may be deleted.
	 When the OS version of the programming pendant is earlier than 1.10 If an SD card formatted in a format other than FAT16, FAT32, or exFAT is used, it will be automatically formatted to exFAT. (OS version is earlier than 1.10: Programming pendant that was set up with system software earlier than YAS4.26-00)
	 When the OS version of the programming pendant is 1.10 or later If an SD card formatted in a format other than FAT16, FAT32, or exFAT is used, error 3080 "I/O error on the media" is displayed, and the SD card will not be automatically formatted to exFAT.

7.1.1.1 Recommended SD Card

Refer to "YRC1000 INSTRUCTIONS (RE-CTO-A221) 9.1.2 Device" for the recommended products used for external memory of YRC1000. Model numbers are subject to be updated due to termination of product and new addition. Contact YASKAWA representative when necessary.

7.1.1.2 Notes on Handling SD Card

- Do not drop or bend exerting any shock or strong force to the SD card.
- Keep away from water, oil, organic solvent, dust, dirt, etc.
- Do not use or keep the SD card in places where strong static electricity or electronic noise may occur.
- Do not insert or remove the SD card or turn OFF the power when accessing the SD card (writing-in or reading-out the data).
- To protect the data, back up the data regularly on other media. Damages or loss of data due to operation errors or accidents can be minimized.

*An SD card has a limited life span.

The life span differs depending on products or status of use. However, normal use of SD card as an external memory device for the YRC1000 does not adversely affect the SD card. For details, refer to instruction manuals for each medium.

- 7 External Memory Device
- 7.1 Memory Device

7.1.1.3 Inserting an SD Card

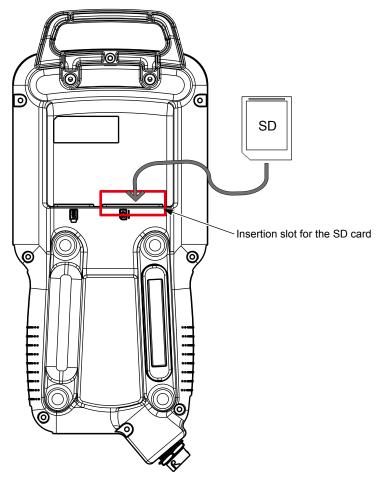

When inserting an SD card, take note of insertion direction.

Keep the programming pendant with its back side up. Keep the SD card with its top surface up and with its connector downward, and insert it into the SD card slot on the back side of the programming pendant.

Forcible insertion may result in damage to the SD card or the SD card slot.

After inserting the card, be sure to close the cover of the slot before starting operation.

Fig. 7-1: Using an SD Card

Back Side of Programming Pendant

- 7 External Memory Device
- 7.1 Memory Device

7.1.2 USB Memory Stick

USB memory sticks can be used as media for external storage.

When using a USB memory stick as an external storage device, insert it into the USB connector built into the programming pendant or the CPU board (JANCD-ACP01).

The USB memory stick must meet the following requirements.

File system: Formatted in FAT16 or FAT32.

NOTE	If a USB memory stick with a file system other than FAT16, FAT32, or exFAT is used for the programming pendant, automatic formatting will be performed and the data stored on the USB memory stick may be deleted.
	 When the OS version of the programming pendant is earlier than 1.10 If a USB memory stick formatted in a format other than FAT16, FAT32, or exFAT is used, it will be automatically formatted to exFAT. (OS version is earlier than 1.10: Programming pendant that was set up with system software earlier than YAS4.26-00)
	 When the OS version of the programming pendant is 1.10 or later If a USB memory stick formatted in a format other than FAT16, FAT32, or exFAT is used, error 3080 "I/O error on the media" is displayed, and the USB memory stick will not be automatically formatted to exFAT.

7.1.2.1 Recommended USB Memory Stick

Refer to in "YRC1000 INSTRUCTIONS (RE-CTO-A221) 9.1.2 Device" for the recommended products used for external memory of the YRC1000. Model numbers are subject to be updated due to termination of product and new addition. Contact YASKAWA representative when necessary.

7.1.2.2 Notes on Handling USB Memory Stick

- Do not drop or bend exerting any shock or strong force to the USB memory stick.
- Keep away from water, oil, organic solvent, dust, dirt, etc.
- Do not use or keep the USB memory stick in places where strong static electricity or electronic noise may occur.
- Do not insert or remove the USB memory stick or turn OFF the power when accessing the USB memory stick (writing-in or reading-out the data).
- To protect the data, back up the data regularly on other media. Damages or loss of data due to operation errors or accidents can be minimized.

*USB memory stick has a limited life span.

The life span differs depending on products or status of use. However, normal use of USB memory stick as an external memory device for the YRC1000 does not adversely affect the USB memory stick. For details, refer to instruction manuals for each medium.

- 7 External Memory Device
- 7.1 Memory Device

7.1.2.3 Rules for USB Connector and USB Memory Stick

Followings are the rules of the USB connector on the CPU board (JANCD-ACP01) and the USB memory stick to be installed.

1. Prohibition of insertion/removal of the USB memory stick during control power ON

The device recognition process is executed when the USB memory stick is inserted. Do not insert or remove the USB memory stick while the control power supply is ON. Failure to observe this rule may affect the operation of the manipulator (cycle time).

- Prohibition of disconnection of the control power and insertion/ removal of USB memory stick during file access Do not disconnect the control power or insert/remove the USB memory stick during file access. Failure to observe this rule may breakdown the FAT.
- 3. **Operating temperature range of USB memory stick** Use a USB memory stick that is guaranteed to work in the range of temperature of the YRC1000.
- 4. **USB memory stick's falling off by controller vibration** Prevent the USB memory stick from falling off by the vibration of the controller.

(Countermeasure example)

• Fix the USB memory stick with jigs not to fall off, etc.

5. USB connector on the front surface of the CPU board (JANCD-ACP01)

The USB connector on the front surface of the CPU board (JANCD-ACP01) accepts only the USB memory stick.

Do not connect a USB hub or other USB devices.

- 7 External Memory Device
- 7.1 Memory Device
- 7.1.2.4 Inserting a USB Memory Stick in Programming Pendant

When inserting a USB memory stick, take note of insertion direction.

Keep the programming pendant with its back side up. Keep the USB memory card with its top surface up and with its connector downward, and insert it into the USB memory stick connector on the back side of the programming pendant.

Forcible insertion may result in damage to the USB memory stick or USB connector.

After inserting the stick, be sure to close the cover of the connector before starting operation.

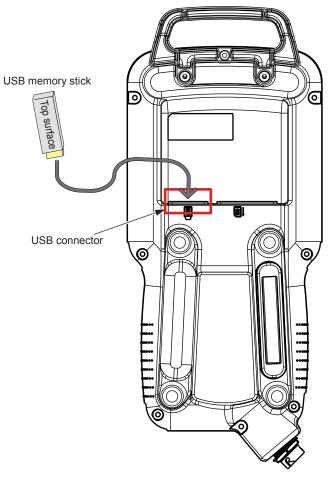

Fig. 7-2: Using a USB Memory Stick

Back Side of Programming Pendant

When a USB memory stick is used, the waterproof property of the programming pendant cannot be maintained.

If the USB memory stick is always set in the programming pendant, the stick may fall out of the pendant.

If it is impossible to maintain the waterproof property of the programming pendant or to prevent the USB memory stick from falling out of the programming pendant, use an SD card instead.

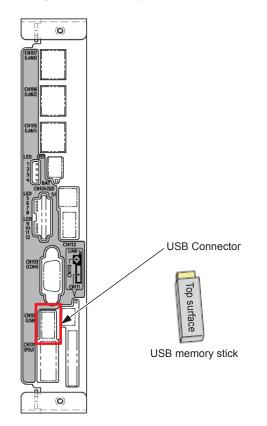

- 7 External Memory Device
- 7.1 Memory Device

7.1.2.5 Inserting a USB Memory Stick in the CPU Board (JANCD-ACP01)

Make sure to insert the USB memory stick with its connector kept in the correct direction: Keep the USB memory stick with its top surface right, and insert it slowly into the connector on the CPU board.

Forcible insertion may result in damage to the USB memory stick or USB connector.

Fig. 7-3: Using a USB Memory Stick on the CPU Board

7 External Memory Device

7.2 Handling Data

7.2 Handling Data

7.2.1 Data Classification

For the YRC1000, data that can be saved online are classified into seven categories.

1. JOB

- 2. FILE/GENERAL DATA
- 3. PARAMETER¹⁾
- 4. I/O DATA
- 5. SYSTEM DATA
- 6. PENDANT LOG
- 7. SYSTEM BACKUP (CMOS.BIN)

Data saved on the external memory device can be loaded again into the YRC1000.

Each data in the seven categories varies depending on applications or options.

When the device is set to "PC" or "FTP", data cannot be handled other than "1. JOB" and "2. FILE/GENERAL DATA".

Also, the "1. JOB" whose name consists of more than nine letters cannot be handled at "FC1".

The pendant log is available for YAS2.60-00 or later. The only devices available are "SD:Pendant" and "USB:Pendant". When the pendant application error does not occur, the pendant log is not output. It is not included in the system backup.

PARAMETER, SYSTEM DATA, I/O DATA, and SYSTEM BACKUP (CMOS.BIN), which includes the data of the former three data, have inherent information of each controller.

If those data are loaded by other controllers, unintended data overwriting, unexpected operation, or abnormal system startup may occur.

Do not load those backup data into other controllers.

If two controllers are loaded with the same job, paths of the two manipulators are different due to the home positions or mechanical error of the component parts.

Be sure to check the operation instruction before operation.

^{1 &}quot;PARAMETER BATCH" includes all "3. PARAMETER".

- 7 External Memory Device
- 7.2 Handling Data

7.2.2 File Existence

The following data categories show whether the same file name as a file that is going to be saved is in the external memory device or not.

• JOB

No mark appears when the selected folder has the file of the same name.

The asterisk (*) appears when the folder does not have the same name file.

The maximum number of files displayed in one folder is 10240 files.

 FILE/GENERAL DATA, PARAMETER, SYSTEM DATA, I/O DATA Black circle (

) appears when the selected folder has the file of the same name.

White circle ($_{\odot}\,$) appears when the folder does not have the same name file.

Whether the job after editing is saved or not can be judged by checking "TO SAVE TO FD" in the JOB HEADER window.

7 External Memory Device

7.2 Handling Data

7.2.2.1 Saving by Overwriting

"6. PENDANT LOG" and "7. SYSTEM BACKUP (CMOS.BIN)" can be overwritten.

As for "1. JOB", "2. FILE/GENERAL DATA", "3. PARAMETER", "4. I/O DATA", and "5. SYSTEM DATA", those data can be overwritten if overwrite mode is valid when saving files. However, those data cannot be overwritten if overwrite mode is invalid when saving files. If the mode is invalid, delete the target file in the device before the saving operation.

For details on the settings for overwriting when saving a file, refer to *chapter 7.3.0.4 "Overwriting When Saving a File"*.

If "SD: Pendant", "USB: Pendant", or "USB1: Controller" is used as the device, another folder can be created to save the data. For details on folders, refer to *chapter 7.3.0.2 "Folder Operation"*.

7 External Memory Device

7.3 Operation Flow

7.3 Operation Flow

The following description is the operation flow for external memory devices.

 SELECT DEVICE Select {EX. MEMORY} → {DEVICE}, and the destination device for saving.

The device selected is valid after turning the power supply ON again.

 SELECT FOLDER Select {EX. MEMORY} → {FOLDER}, and the destination folder for saving.
 The folder selected is invalid after turning the power supply ON

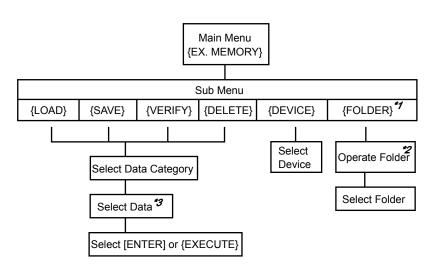

again.

*1: {FOLDER} appears when using the "SD: Pendant", "USB: Pendant" or "USB1: Controller" as a device.

*2 The settings of {CREATE NEW FOLDER}, {DELETE FOLDER}, and {ROOT FOLDER} can be set.

- SELECT SUB MENU Select an operation to be performed from {LOAD}, {SAVE}, {VER-IFY}, and {DELETE}.
- SELECT DATA CATEGORY Select the target data category.
- SELECT DATA Select the target data.
 "7.SYSTEM BACKUP (CMOS.BIN)" does not require this operation.
 3 Individual selection, batch selection, marker () selection, and canceling selection can be performed.
- EXECUTE

Select [ENTER] or {EXECUTE}.

- 7 External Memory Device
- 7.3 Operation Flow

7.3.0.1 Selecting the Device

Select the device used as an external memory for saving and loading data.

- 1. Select {EX. MEMORY} under {Main Menu}.
- 2. Select {DEVICE}.
 - The DEVICE / SETUP screen appears.

DATA	EDIT	DISPLAY	UTILITY	12 🗹 🖌	1 👒 🔟	🕞 🙌	
EX. MEMOR So PARAMETER PARAMETER SAFETY FUN SAFETY FUN PM DISPLAY SET MAB		ICE / SETUP EVICE ILE SAVE OV OB LOAD OVE	ERWRITE	SD: Pendar INVAL ID	ıt		
Main Menu	Simp	ole Menu					

DEVICE

Select the device used as an external memory for saving and loading data. The selected device is valid after turning the power supply ON again.

- SD: Pendant
- USB: Pendant
- USB1: Controller
- FILE SAVE OVERWRITE
 - Set overwrite mode when saving files to invalid/valid. INVALID: Prohibits overwriting when saving files. VALID: Permits overwriting when saving files.
- JOB LOAD OVERWRITE

Set overwrite mode when loading jobs to invalid/valid. INVALID: Prohibits overwriting when loading a file. VALID: Permits overwriting when loading a file.

If overwriting when loading jobs is set to valid:

When overwriting is executed, jobs stored in the controller are deleted.

Before overwriting, check whether backup of the jobs is necessary.

- 7 External Memory Device
- 7.3 Operation Flow

7.3.0.2 Folder Operation

Folders can be used in order to classify and sort out the data such as jobs and condition files when using the "SD: Pendant", "USB: Pendant" or "USB1: Controller". The folders can be created in hierarchical structure positioning a root folder at the top.

Restrictions

Folder name: Up to 8 characters + 3 characters for extension *Long folder names cannot be used such as the name that exceeds the restricted number of characters mentioned above as created in PC, etc.

Maximum path length: 48 characters

*"ERROR 3360: INVALID FOLDER" appears when selecting the folder of which name exceeds the maximum path length.

Selecting a Folder

- 1. Select {EX. MEMORY} under {Main Menu}.
- 2. Select {FOLDER}.
 - The FOLDER LIST window appears.
- 3. Move the cursor to a folder and press [SELECT].
 - A folder can be selected.
- 4. To move the hierarchy from a child folder to a parent folder, move the cursor to [..] and press [SELECT].

DATA	EDIT	DISPLAY	UTILITY	12 🗹 🖬 😣	10 🖳 🛉 🎛 👘

[]	FOLDER:	2			
Main Men	u Simp	le Menu			

Creating a Folder

- 1. Set the security mode to the management mode or higher. Select {EX. MEMORY} under {Main Menu}.
- 2. Select {FOLDER}.
 - The FOLDER LIST window appears.
- 3. Move the cursor to a folder and press [SELECT].
 - Select the higher-level folder where a new folder to be created should be contained.
 - When creating a folder in top-level, this step is unnecessary.
- Select {DATA} → {CREATE NEW FOLDER} under the pull-down menu. Enter the folder name by using the keyboard on the screen and press [ENTER].
 - A folder is created.

- 7 External Memory Device
- 7.3 Operation Flow

Deleting a Folder

- 1. Set the security mode to the management mode or higher. Select {EX. MEMORY} under {Main Menu}.
- 2. Select {FOLDER}.
 - The FOLDER LIST window appears.
- 3. Move the cursor to a folder and press [SELECT].
 - Select the higher-level folder where a folder to be deleted is contained.
 - When deleting a folder in top-level, this step is unnecessary.
- 4. Delete the files and subfolders beforehand inside the folder that is to be deleted.
 - A folder cannot be deleted if the folder contains files or subfolders inside.

Move the cursor to the folder to be deleted.

5. Select {DATA} \rightarrow {DELETE FOLDER} under the pull-down menu.

- 7 External Memory Device
- 7.3 Operation Flow

Initial Folder Setting

The folder that is contained in a deep hierarchy can be selected in a shortened operation.

When selecting {LOAD}, {SAVE}, {VERIFY}, or {DELETE} from the sub menu of {EX. MEMORY}, the folder that has been set as an initial folder becomes a current folder.

- 1. Set the security mode to the management mode or higher. Select {EX. MEMORY} under {Main Menu}.
- 2. Select {FOLDER}.
 - The FOLDER LIST window appears.
- 3. Move the cursor to a folder and press [SELECT].
 - Select a folder that is to be set as a root folder.
- 4. Select {DISPLAY} \rightarrow {ROOT FOLDER} under the pull-down menu.
 - The INITIAL FOLDER SETTING window appears.

- 7 **External Memory Device**
- 7.3 **Operation Flow**

7.3.0.5 Loading Data

To upload data from the external memory device to the memory of the YRC1000, follow the procedure in the following.

> PARAMETER, SYSTEM DATA, I/O DATA, and SYSTEM BACKUP (CMOS.BIN), which includes the data of the former three data, have inherent information of each controller.

If those data are loaded by other controllers, unintended data overwriting, unexpected operation, or abnormal system startup may occur.

Do not load those backup data into other controllers.

If two controllers are loaded with the same job, paths of the two manipulators are different due to the home positions or mechanical error of the component parts.

Be sure to check the operation instruction before operation.

Take extra care for the saved data.

When the ladder program used in the DX200 is tried to be loaded, the confirmation dialog "DX200 CIOPRG DOWN-LOAD?" is displayed. Select "YES" to load the ladder program of the DX200. If [CANCEL] is pressed or "NO" is selected while this dialog is displayed, the ladder program will not be loaded.

When the ladder program used in the DX200 is loaded to the YRC1000, make sure to confirm that the APPLI of the program in the DX200 system and the YRC1000 system to which the program is loaded are the same. Do not load the ladder program which has a different APPLI. The "different APPLI" also means the case that the number of APPLIs are

different (ex. "Arc" and "Arc + Arc").

The ladder program used in the DX100 can also be loaded to the YRC1000.

If the ladder program used in the DX100/DX200 for arc welding is loaded to the YRC1000, some new functions added in the DX200 cannot be used (only for arc welding). In order to use the new functions added in the DX200, reflect the content edited in the DX100/DX200 to the YRC1000 ladder program without loading the ladder program of the DX100/DX200.

7.3.0.9 Job Selection Mode

The method of selecting a job and various data files when loading, saving, verifying, and deleting are described in the following:

- Individual Selection Jobs and data files are selected individually one at a time.
- Batch Selection Jobs and data files are selected all at one time.
- Marker (*) Selection
 Loading: selects the files in the external memory device.
 Saving: selects the files in the memory of the YRC1000.
 Verifying: selects both the files in the external memory device and in the memory of the YRC1000.
- Batch Selection (individual file) Jobs and data files (FILE/GENERAL DATA, PARAMETER, I/O DATA, SYSTEM DATA) are selected all at one time. This operation can be performed on the window where the data type of the external memory device is selected. Only in the case of saving and verifying, operation of the external memory device can be performed.

Pendant logs, system backups, user definition files (when the optional function is enabled) are not included in batch selection.

- 7 External Memory Device
- 7.3 Operation Flow

Using Individual Selection

1. In either the external memory JOB LIST window or the file selection window, move the cursor to a job or a file to be selected.

- 7.3 Operation Flow

■ Using Batch Selection (individual file)

For two or more types of data (JOB, FILE/GENERAL DATA, PARAMETER, I/O DATA, SYSTEM DATA), the data can be selected all at one time. This operation can be performed when saving or verifying the data in the external memory device.

 On the window where the types of data in the external memory device are selected, select {SELECT ALL (INDIVIDUAL)} from the pull-down menu {EDIT}.

	DATA	EDIT	DISPLAY	UTILITY	12 🖻 📶 🦻	à 🙋 📮 👆

3. Press [ENTER].

- 7 External Memory Device
- 7.3 Operation Flow
- 4. The confirmation dialog box appears.

When saving the data, "Do you save all individual files?" appears. When verifying the data, "Do you verify all individual files?" appears.

- Move the cursor to the data type (JOB, FILE/GENERAL DATA, PARAMETER, I/O DATA, SYSTEM DATA) and press [SHIFT] + [SELECT] to individually select/cancel the data type.
 - To perform operation (save/verify) of the external memory device all at one time for one specific data type, press [SHIFT] + [SELECT], and while the specific data type is selected, perform the steps 3 to 5 above.

To cancel all the selection on the window where the data type is selected, select {CANCEL ALL (INDIVIDUAL)} from the pull-down menu {EDIT}. The selection of the data types is canceled all at one time, and the signs " \star " on the left of JOB, FILE/GENERAL DATA, PARAMETER, I/O DATA, and SYSTEM DATA are hidden.

- 8 Parameter
- 8.1 Parameter Configuration

8 Parameter

8.1 Parameter Configuration

The parameters of YRC1000 can be classified into the following seven:

Motion Speed Setting Parameter:

Determines the manipulator motion speed for jog operation at teaching, test operation, or playback operation.

Mode Operation Setting Parameter:

Makes the setting for various operations in the teach mode or remote mode.

Parameter according to Interference Area:

Limits the P-point maximum envelope of the manipulator or sets the interference area for axis interference or cubic interference.

Parameter according to Status I/O:

Sets the parity check or I/O setting for user input/output signals.

Parameter according to Coordinated or Synchronized Operation:

Makes the settings for coordinated or synchronized operations between manipulators or between manipulators and stations.

Parameter for Other Functions or Applications:

Makes the settings for other functions or applications.

Hardware Control Parameter:

Makes the hardware settings for fan alarm or relay operation, etc.

	S1CxG Parameters
SUPPLE	The initial setting of S1CxG parameters depends on the manipulator model.
-MENT	For a system in which two manipulators are controlled, the following two types of parameters are used: S1C1G type and S1C2G type.

- 8 Parameter
- 8.2 Motion Speed Setting Parameters

8.2 Motion Speed Setting Parameters

These parameters set the manipulator motion speed for jog operation at teaching, test operation, or playback operation.

8.2.0.1 S1CxG000: IN-GUARD SAFE OPERATION MAX. SPEED

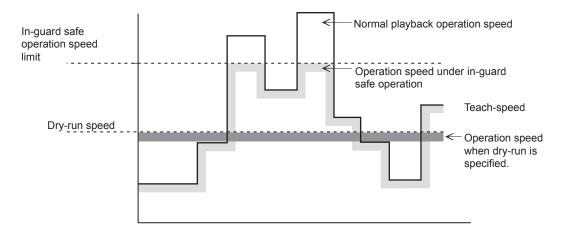

Units: 0.01%

The upper speed limit is set for in-guard safe operation. While the inguard safe operation command signal is being input, the TCP speed is limited to the in-guard safe operation maximum speed.

8.2.0.2 S1CxG001: DRY-RUN SPEED

Units: 0.01%

This is a dry-run operation speed setting value used when checking the path. Take safety into consideration when setting changes are unnecessary.

8.2.0.3 S1CxG002 to S1CxG009: JOINT SPEED FOR REGISTRATION

Units: 0.01%

The value set in these parameters is registered as the joint speed for each speed level when teaching the position data with the programming pendant. The percentage corresponding to the set value at each level is registered as 100% of the value set in the playback speed limit. Values greater than those set as speed limit values cannot be set.

```
S1CxG002: Level 1
S1CxG003: Level 2
```

S1CxG009: Level 8

- 8 Parameter
- 8.2 Motion Speed Setting Parameters

8.2.0.4 S1CxG010 to S1CxG017: LINEAR SPEED FOR REGISTRATION

Units: 0.1mm/s

The value set in these parameters is registered as the linear speed for each speed level when teaching the position data with the programming pendant. Values greater than those set as playback speed limit values cannot be set.

S1CxG010: Level 1 S1CxG011: Level 2 . . . S1CxG017: Level 8

8.2.0.5 S1CxG018 to S1CxG025: POSITION ANGLE SPEED

Units: 0.1°/s

The value set in these parameters is registered as the position angle speed for each speed level when teaching the position data with the programming pendant. Values greater than those set as playback speed limit cannot be set.

8.2.0.6 S1CxG026 to S1CxG029: JOG OPERATION ABSOLUTE VALUE SPEED

Units: 0.1mm/s

These are setting values of jog operation speed set by the programming pendant. Values greater than those set as jog operation speed limit value cannot be set.

S1CxG026	Low level	:	Jog operation speed when "LOW" manual speed is specified.
S1CxG027	Medium level	:	Jog operation speed when "MEDIUM" manual speed is specified.
S1CxG028	High level	:	Jog operation speed when "HIGH" manual speed is specified.
S1CxG029	High-speed-level	:	Jog operation speed when [HIGH SPEED] is pressed.

- 8 Parameter
- 8.2 Motion Speed Setting Parameters

8.2.0.7 S1CxG030 to S1CxG032: INCHING MOVE AMOUNT

These parameters specify the amount per move at inching operation by the programming pendant. The referenced parameter differs according to the operation mode at inching operation.

S1CxG030	: Joint Operation (Unit: 1 pulse)
S1CxG031	: Cartesian/cylindrical (Unit: 0.001 mm)
S1CxG032	: Motion about TCP (Unit: 0.0001 degree)

SUPPLE If the value set for S1CxG031 or S1CxG032 is too small, the inching operation does not proceed.

8.2.0.8 S1CxG033 to S1CxG040: POSITIONING ZONE

Units: μm

This parameter value will be referenced when positioning is specified with the "MOVE" instruction: MOVJ (joint movement) or MOVL (linear movement).

<Example> MOVL V=100.0 PL=1

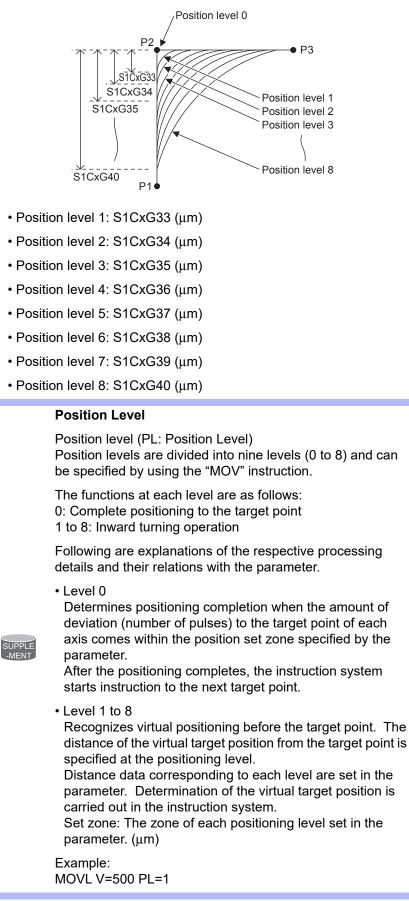

Positioning level
 Positioning specification

The value set in this parameter specifies the range to enter in relation to the teaching point for that step positioning.

After entering the specified positioning zone, the manipulator starts moving to the next step. The system is also set up so inward turning operation is carried out in the moving section when moving to the next path; speed changeover is smooth.

- 8 Parameter
- 8.2 Motion Speed Setting Parameters

Since operation will be turning inward during playback, as shown in the following diagram, use setting values taking safety aspects into consideration.

- 8 Parameter
- 8.2 Motion Speed Setting Parameters

8.2.0.9 S1CxG044: LOW-SPEED START

Units: 0.01%

This parameter specifies max. speed at low speed start. Specify the starting method for "initial operation speed of manipulator" (S2C217).

8.2.0.10 S1CxG045 to S1CxG048: JOG OPERATION LINK SPEED

Units: 0.01%

These parameters prescribe the link speed at jog operation by the programming pendant. Specify the percentage (%) for the jog operation speed limit, the joint max. speed.

S1CxG045: Jog operation link speed at level "LOW"

S1CxG046: Jog operation link speed at level "MEDIUM"

S1CxG047: Jog operation link speed at level "HIGH"

S1CxG048: Jog operation link speed at level "HIGH SPEED"

8.2.0.11 S1CxG056: WORK HOME POSITION RETURN SPEED

Units: 0.01%

This parameter specifies the speed for returning to work home position against the maximum speed.

8.2.0.12 S1CxG057: SEARCH MAX. SPEED

Units: 0.1mm/s

This parameter specifies the max. speed for searching.

8.2.0.13 S2C201: POSTURE CONTROL AT CARTESIAN OPERATION OF JOG

This parameter specifies whether or not posture control is performed at Cartesian operation of "JOG" by the programming pendant. Use posture control unless a special manipulator model is used.

- 0 : With posture control
- 1 : Without posture control

- 8 Parameter
- 8.2 Motion Speed Setting Parameters

8.2.0.14 S2C202: OPERATION IN USER COORDINATE SYSTEM (WHEN EXTERNAL REFERENCE POINT CONTROL FUNCTION USED)

This parameter specifies the TCP or reference point of motion about TCP when the external reference point control function is used and the user coordinate system is selected by the programming pendant.

Fig. 8-1: 0: When manipulator TCP is selected

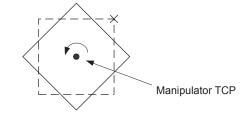

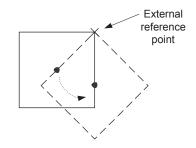

Fig. 8-2: 1: When external reference point is selected

8.2.0.15 S2C320: CONTROLLED GROUP JOB TEACHING POSITION CHANGE

This parameter is used to change only the job teaching position of controlled group axis.

- 0 : Not changed
- 1 : Changed

8.2.0.16 S2C422: OPERATION AFTER RESET FROM PATH DEVIATION

8.2.0.17 S2C423: OPERATION AFTER JOB

These parameters specify the method of restarting the manipulator that has deviated from the normal path such as an emergency stop or jog operation.

- 0 : Moves to the indicated step (initial setting).
- 1 : After moving back to the deviated position, moves to the indicated step.
- 2 : Moves back to the deviated position and stops.

8 Parameter

8.2 Motion Speed Setting Parameters

Parameter setting value	Movement when restarting		
0	Moves to next step.		
	Emergency	stop	
	Movement when restart	Moves to the next step.	
1	After moving back to the deviated position, moves to the indicated step.		
	Emergency stop		
		Moves back to the deviated position and stops. When restarting, moves to the indicated step.	
2			
	Emergency stop (Servo OFF)	
		Moves back the the deviated position and then moves to the indicated step.	

Table 8-2: S2C423

Parameter setting value	Movement when restarting
0	Moves to the next step.
1	After moving back to the deviated position, moves to the indicated step. Emergency stop (Servo OFF) Moves back to the deviated position and then moves to the indicated step.
2	Emergency stop (Servo OFF) Moves back to the deviated position and stops. When restarting, moves to the indicated step.

• The manipulator moves to the path deviated position in a linear movement at the low speed of the low-speed start (S1CxG044). After resetting from deviation, the manipulator operates at the taught speed.

• The factory-set value is 0: The manipulator moves in a straight line from the present position to the indicated step.

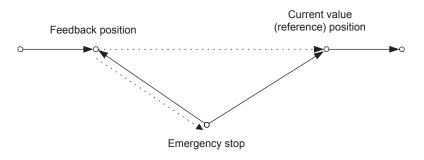

- 8 Parameter
- 8.2 Motion Speed Setting Parameters

8.2.0.18 S2C424: DEVIATED POSITION

This parameter specifies whether deviated position is to be robot current (reference) position or feedback position.

- 0 : Return to the feedback position.
- 1 : Return to the current value (reference) position.

When emergency stop is applied during high-speed motion, the deviated position differs from the robot current value (reference) position and feedback position as shown in the following.

8.2.0.19 S2C425: CIRCULAR INTERPOLATION TOOL POSITION CONTROL

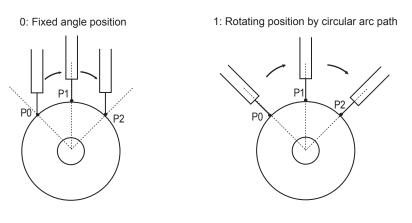

This parameter selects tool position control methods at circular interpolation operation.

0 : Fixed angle position

Interpolation is performed depending on the position change viewed from the base coordinate.

As the figure below (left) shows, when tool position viewed from outside is not significantly changed and that position is mainly taught at teaching, this setting is required.

 1 : Rotating position by circular arc path Interpolation is performed depending on the position change corresponding to circular arc path.
 As the figure below (right) shows, when tool position corresponding to circular arc path (tool position viewed from the center of the circular arc) is not significantly changed, and that position is mainly taught at teaching, this setting is required.

- 8 Parameter
- 8.2 Motion Speed Setting Parameters

8.2.0.20 S2C653: EMERGENCY STOP CURSOR ADVANCE CONTROL FUNCTION

This parameter specifies whether to use the cursor advance control function or not.

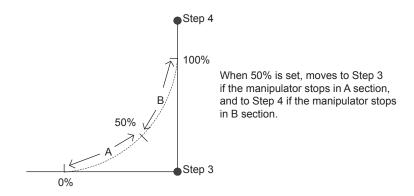

0: Not use

1: Use

8.2.0.21 S2C654: EMERGENCY STOP CURSOR ADVANCE CONTROL FUNCTION CONT PROCESS COMPLETION POSITION

Units: %

When the manipulator stops during moving inner corner by CONT process, this parameter specifies which position of the inner corner should be considered as the end of step.

8.2.0.22 S2C655: EMERGENCY STOP ADVANCE CONTROL FUNCTION WORK START INSTRUCTION STEP MOTION COMPLETION DELAY TIME

Units: ms

In order to recognize securely the completion of motion to the step of work start instruction (such as ARCON instruction), this parameter specifies the delay time for motion completion of the work start instruction step only.

8.2.0.23 S2C698: BASE AXIS OPERATION KEY ALLOCATION SETTING

		-
Coordinates/Parameter	S2C698= "0"	S2C698= "1"
Joint	Axis number order	Specified
Cylindrical	Axis number order	Specified
Cartesian	Specified	Specified
Tool	Specified	Specified
User	Specified	Specified

Table 8-3: Parameter Setting and Jog Operation Key Allocation

Axis number order: X: First axis, Y: Second axis, Z: Third axis

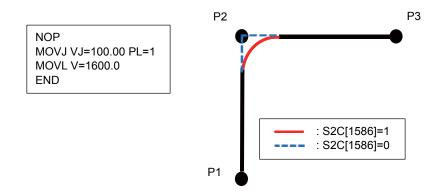

Specified: X: X-direction (RECT-X), Y: Y-direction (RECT-Y), Z: Z-direction (RECT-Z)

- 8 Parameter
- 8.2 Motion Speed Setting Parameters

8.2.0.24 S2C[1586]: INWARD-TURNING OPERATION ENABLE DURING MOVJ - MOVL POSITIONING

These parameters specify whether the inward-turning operation is executed when positioning is set between the MOVJ - MOVL commands.

- 0: Execution OFF
- 1: Execution ON

8.2.0.25 S3C1098 to S3C1102: POSITION CORRECTING FUNCTION DURING PLAYBACK

These parameters specify the necessary data for position correcting function (PAM) during playback operation.

S3C1098	Specifies the limit of position correcting range (Units: $\mu\text{m})$
S3C1099	Specifies the limit of speed correcting range (Units: 0.01%)
S3C1100	Specifies the correcting coordinates 0: Base 1: Robot 2: Tool 3: User 1 to 65:User 63
S3C1102	Specifies the limit of posture angle adjustment range (Units: 0.01°)

8 Parameter

8.3 Mode Operation Setting Parameters

8.3 Mode Operation Setting Parameters

These parameters set various operations in the teach mode or remote mode.

Some parameters can be set through {SETUP} \rightarrow {TEACHING COND} or {OPERATE COND}.

8.3.0.1 S2C195: SECURITY MODE WHEN CONTROL POWER SUPPLY IS TURNED ON

The operation level when the control power supply is turned ON is set.

- 0 : Operation Mode
- 1 : Editing Mode
- 2 : Management Mode

8.3.0.2 S2C196: SELECTION OF Cartesian/CYLINDRICAL

This parameter specifies whether the Cartesian mode or cylindrical mode is affected when Cartesian/cylindrical mode is selected by operation (coordinate) mode selection at axis operation of programming pendant. This specification can be done on the TEACHING CONDITION window.

- 0 : Cylindrical mode
- 1 : Cartesian mode

8.3.0.3 S2C197: COORDINATE SWITCHING PROHIBITED

This parameter prohibits switching coordinates during JOG operation by the programming pendant.

- 0 : Switching permitted for tool coordinates and user coordinates
- 1 : Switching prohibited for tool coordinates
- 2 : Switching prohibited for user coordinates
- 3 : Switching prohibited for tool coordinates and user coordinates

8.3.0.4 S2C198: EXECUTION UNITS AT "FORWARD" OPERATION

This parameter specifies the execution units at step mode of "FORWARD" operation by the programming pendant.

Parameter Setting Value	Operation	Units	
0	MOVL DOUT TIMER DOUT MOVL		Stops at every instruction
1	MOVL DOUT TIMER DOUT MOVL		Stops at move instruction

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

8.3.0.5 S2C199: INSTRUCTION (EXCEPT FOR MOVE) EXECUTION AT "FORWARD" OPERATION

This parameter specifies the method of instruction (except for move) execution at "FORWARD" operation by the programming pendant.

- 0 : Executed by pressing [FWD] + [INTERLOCK]
- 1 : Executed by pressing [FWD] only
- 2 : Instruction not executed

8.3.0.6 S2C203: CHANGING STEP ONLY

This parameter specifies whether to permit only step changes in an editing-prohibited job. When permitted, only position data can be changed but additional data such as speed cannot be changed. This specification can be done on the TEACHING CONDITION window.

- 0 : Permitted
- 1 : Prohibited

8.3.0.7 S2C204: MANUAL SPEED STORING FOR EACH COORDINATE

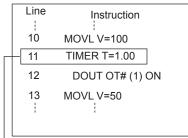

This parameter specifies whether to assign different manual speeds for the joint coordinates and other coordinates. If "NOT STORED" is selected, manual speed is not affected by changing the coordinates. If "STORED" is selected, manual speeds can be selected separately for the joint coordinates and other coordinates.

- 0 : Not stored
- 1 : Stored

8.3.0.8 S2C206: ADDITIONAL STEP POSITION

This parameter designates either "before next step" or "after the cursor position (between instructions)" as additional step position. This specification can be done on the TEACHING CONDITION window.

- 8 Parameter
- 8.3 Mode Operation Setting Parameters
- Fig. 8-3: <Example>

Cursor position

Fig. 8-4: S2C206-0 (Before the Next Step)

Instruction	
MOVL V=100	
TIMER T=1.00	
DOUT OT#(1)	ON

13	DOUT OT# (1) ON	
14	MOVL V=50	
i		
	•	

Added step

8.3.0.9 S2C207: MASTER JOB CHANGING OPERATION

This parameter specifies whether to permit or prohibit master job changing operation. If "PROHIBIT" is specified, the master job cannot be changed (or registered) easily. The specification can be done on the OPERATING CONDITION window.

- 0 : Permitted
- 1 : Prohibited

8.3.0.10 S2C208: CHECK AND MACHINE-LOCK KEY OPERATION IN PLAY MODE

This parameter specifies whether to permit or prohibit in play mode to change the operation that changes the operation condition. Even if an error occurs because of the operation with the keys, the manipulator does not stop. The specification can be done on the OPERATING CONDITION window.

- 0 : Permitted
- 1 : Prohibited

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

8.3.0.11 S2C209: RESERVED WORK JOB CHANGING OPERATION

This parameter specifies whether to permit reserved work job changing operation.

The designation can be done on the OPERATING CONDITION window.

- 0 : Permitted
- 1 : Prohibited

8.3.0.12 S2C210: MASTER OR SUBMASTER CALL OPERATION IN PLAY MODE

This parameter specifies whether the master or submaster call operation in play mode is permitted or not. When the independent control function is valid, the master job for sub-task is specified at the same time. Select $\{\text{SETUP}\} \rightarrow \{\text{PLAYBACK COND.}\}$ and specify permissions for the master or submaster call operation in play mode in $\{\text{MASTER CALLING UP}\}$.

- 0 : Permitted
- 1 : Prohibited

8.3.0.13 S2C211: LANGUAGE LEVEL

This parameter specifies the level of the robot language (INFORM III). The levels simplify the instruction registering operation. With the YRC1000, all robot instructions can be executed regardless of specification of instruction sets. The specification can be done on the TEACHING CONDITION window. For details, refer to "YRC1000 INSTRUCTIONS (RE-CTO-A221) 8.12 Instruction Level Setting".

0: Contracted Level

Only frequently used robot instructions are selected to reduce the number of instructions to be registered. Robot instructions displayed on the instruction dialog box are also reduced so that specification is simplified.

- 1: Standard Level
- 2: Expanded Level

All the robot instructions are available in standard and expanded levels. The two levels are distinguished by the number of additional information items (tags) that can be used with robot instructions. At the expanded level, the flowing functions are available.

- Local Variables and Array Variables
- Use of Variables for Tags (Example: MOVJ VJ=I000) The above functions are not available at the standard level, however, which reduces the number of data required to register instructions, thereby simplifying the operation.

8.3.0.14 S2C214: INSTRUCTION INPUT LEARNING FUNCTION

This parameter specifies whether to set a line of instructions that has been input on the input buffer line when pressing the first soft key for each instruction. If "PROVIDED" is selected, the instructions are set.

- 0 : Without learning function
- 1 : With learning function

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

8.3.0.15 S2C215: ADDRESS SETTING WHEN CONTROL POWER IS TURNED ON

This parameter specifies the processing of the job name, step No., and line No. that are set when the control power supply is turned ON.

- 0 : Reproduces the address when power supply is turned ON.
- 1 : Lead address (Line"0") of the master job.

8.3.0.16 S2C216: JOB LIST DISPLAY METHOD AT JOB SELECTION

These parameters specify the displaying method on the JOB LIST window at job selection.

- 0 : Order of Names
- 1 : Order of Date

8.3.0.17 S2C217: INITIAL OPERATION OF MANIPULATOR

This parameter specifies the operation speed level of the first section when starting. Specify the operation speed with the low-speed start (S1CxG044). When starting at low-speed, the manipulator stops after reaching the indicated step regardless of the cycle setting. Once the manipulator is paused during the low-speed operation, it moves at teaching speed when restarted.

- 0 : Specified on the SPECIAL PLAY window. Operates at low speed only when low speed start is set. Operates at taught speed when not instructed.
- 1 : Starts at low speed after editing regardless of soft key instructions.

8.3.0.18 S2C218: PLAYBACK EXECUTION AT CYCLE MODE "1- STEP"

Parameter Setting Value	Operation	Units	
0	MOVL DOUT TIMER DOUT MOVL		Stops at every instruction
1	MOVL DOUT TIMER DOUT MOVL		Stops at move instruction

When operating "FORWARD" by the programming pendant, the units for execution are set in another parameter (S2C198).

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

8.3.0.19 S2C219: EXTERNAL START

This parameter specifies whether a start instruction from external input is accepted or not. The specification can be done on the OPERATING CONDITION window.

- 0 : Permitted
- 1 : Prohibited

8.3.0.20 S2C220: PROGRAMMING PENDANT START

This parameter specifies whether a start instruction from the programming pendant is accepted or not.

The specification can be done on the OPERATE ENABLE SETTING window.

- 0 : Permitted
- 1 : Prohibited

8.3.0.21 S2C221: SPEED DATA INPUT FORM

This parameter specifies the units for speed data input and display.

mm/s : in units of 0.1 mm/s

cm/min : in units of 1cm/min

inch/min : in units of 1 inch/min

mm/min : in units of 1 mm/min

The specification can be done on the OPERATE ENABLE SETTING window.

- 0 : mm/sec
- 1 : cm/min
- 2 : inch/min
- 3 : mm/min

8.3.0.22 S2C222: RESERVED START

This parameter specifies whether a reserved start instruction from the programming pendant is accepted or not. The specification can be done on the FUNCTION ENABLE SETTING window.

- 0 : Permitted
- 1 : Prohibited

8.3.0.23 S2C224: JOB SELECTION AT REMOTE FUNCTION (PLAY MODE)

This parameter specifies whether a job selection in play mode at remote function is prohibited or not. The specification can be done on the FUNCTION ENABLE SETTING

The specification can be done on the FUNCTION ENABLE SETTING window.

- 0 : Permitted
- 1 : Prohibited

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

8.3.0.24 S2C225: EXTERNAL MODE SWITCH

This parameter specifies whether mode switching from the outside is accepted or not.

The specification can be done on the OPERATE ENABLE SETTING window.

- 0 : Permitted
- 1 : Prohibited

8.3.0.25 S2C227: EXTERNAL CYCLE SWITCHING

This parameter specifies whether cycle switching from the outside is accepted or not.

The specification can be done on the OPERATE ENABLE SETTING window.

- 0 : Permitted
- 1 : Prohibited

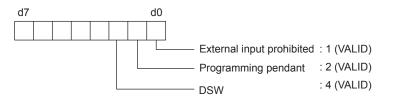

8.3.0.26 S2C228: PROGRAMMING PENDANT CYCLE SWITCHING

This parameter specifies whether cycle switching from the programming pendant is accepted or not. The specification can be done on the OPERATE ENABLE SETTING window.

- 0 : Permitted
- 1 : Prohibited

8.3.0.27 S2C229: SERVO ON FROM EXTERNAL PP PROHIBITION

This parameter specifies whether a servo ON instruction is accepted or not. More than one instruction can be specified. For example, to permit the servo ON instruction from an external input only, set "2". In this case, servo ON instruction from the programming pendant is not accepted. The specification can be done on the OPERATE ENABLE SETTING window.

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

8.3.0.28 S2C230: PROGRAMMING PENDANT OPERATION WHEN "IO" IS SELECTED FOR REMOTE MODE

This parameter specifies whether each operation of the following is valid when "IO" is selected for remote function selection. IO and command are available for remote function selection: "IO" is set prior to shipping. "Command" is valid when transmission function (optional) is specified.

8.3.0.29 S2C234: STEP REGISTRATION AT TOOL NO. CHANGE

The registration of the step when the tool number is changed allows the setting to be made as prohibited.

If this parameter is set to "1" (prohibited), the following operations are prohibited.

- 0 : Permitted
- 1 : Prohibited
 - Modification of a step When the tool number of the teaching step differs from the currentlyselected tool number, the step cannot be modified.
 - Deletion of a step Even if the teaching step position coincides with the current position, the step cannot be deleted when the tool number of the teaching step differs from the currently-selected tool number.
 - Addition of a step When the tool number of the teaching step indicated by the cursor differs from the currently-selected tool number, the step cannot be added.

8.3.0.30 S2C293: REMOTE FIRST CYCLE MODE

This parameter sets the cycle that changes from the local mode to the remote mode.

The specification can be done on the OPERATE CONDITION SETTING window.

- 0 : Step
- 1 : 1 cycle
- 2 : Continuous
- 3 : Not specified

8 Parameter

8.3 Mode Operation Setting Parameters

8.3.0.31 S2C294: LOCAL FIRST CYCLE MODE

This parameter sets the cycle that changes from the remote mode to the local mode.

The specification can be done on the OPERATE CONDITION SETTING window.

- 0 : Step
- 1 : 1 cycle
- 2 : Continuous
- 3 : Not specified

8.3.0.32 S2C312: POWER ON FIRST CYCLE MODE

This parameter sets the first cycle mode for when the power is turned ON.

The specification can be done on the OPERATE CONDITION SETTING window.

- 0 : Step
- 1 : 1 cycle
- 2 : Continuous
- 3 : Not specified

8.3.0.33 S2C313: TEACH MODE FIRST CYCLE MODE

This parameter sets the cycle that changes from the play mode to the teach mode.

The specification can be done on the OPERATE CONDITION SETTING window.

- 0 : Step
- 1 : 1 cycle
- 2 : Continuous
- 3 : Not specified

8.3.0.34 S2C314: PLAY MODE FIRST CYCLE MODE

This parameter sets the cycle that changes from the teach mode to the play mode.

The specification can be done on the OPERATE CONDITION SETTING window.

- 0 : Step
- 1 : 1 cycle
- 2 : Continuous
- 3 : Not specified

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

8.3.0.35 S2C316: START CONDITION AFTER ALARM-4107 ("OUT OF RANGE (ABSO DATA)")

This parameter specifies the activating method after the alarm 4107 ("OUT OF RANGE (ABSO DATA)") occurs.

The specification can be done on the PLAYBACK CONDITION SETTING window.

- 0 : Position check operation required
- 1 : Low-speed start up

8.3.0.36 S2C395: SIGNAL NAME ALIAS FUNCTION

On the JOB CONTENT window, the name registered to the user input/ output signal number can be displayed as alias instead of the signal number itself.

Table 8-4: S2C395

Parameter Setting Value	Valid/Invalid
0	Function invalid
1	Function valid

- With this function valid, the confirmation dialog box "Register by name (alias)?" is displayed when a signal (IN#(), OT#(), IG#(), OG#(), IGH#(), OGH#()) is selected on the DETAIL EDIT window.
- Select "YES" and the signal select window appears. Then select the target signal of number and press [ENTER], and the registered name is displayed instead of the signal number. However, if the signal number's name is not yet registered, it is displayed by number as usual.

<Example> Registration of the name of user output OUT#0001 as "OUTPUT 1"

In the case of DOUT instruction:

S2C395=0 : DOUT OT#(1) ON S2C395=1 : DOUT OT#(OUTPUT 1) ON

8 Parameter

8.3 Mode Operation Setting Parameters

Select {IN/OUT} \rightarrow {UNIVERSAL INPUT/OUTPUT} to edit signal names on the window. Up to 16 characters can be entered as a signal name. However, when this function is valid, if the content below is entered, the error message shows and the name cannot be registered.

- The name already registered
- Letters beginning with a number
- Letters including the signs below:
- (,) , [,] , = , < , > , space, comma
- Letters beginning with "alphabets representing variables" + "number"

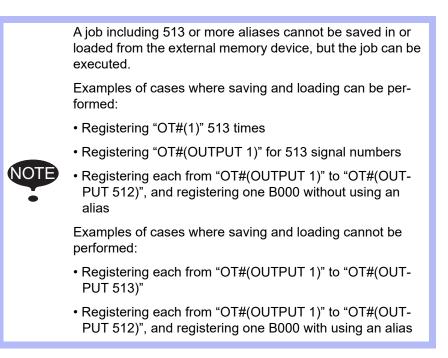

<Example> B0..., I0..., BP1..., LEX2...

Alphabets representing variables: B, I, D, R, S, P, BP, EX, PX, LB, LI LD, LR, LS, LP, LBP, LEX, LPX

When the name begins with "'", it is regarded as a comment and the same comment can be registered for two or more signals. In this case, although this function is valid, the number is displayed on the JOB CONTENT window instead of the name.

<Example> Registration of the name of user output OUT#0002 as " 'OUTPUT 2" S2C395=0 : DOUT OT#(2) ON S2C395=1 : DOUT OT#(2) ON

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

8.3.0.37 S2C396: VARIABLE NAME ALIAS FUNCTION

On the JOB CONTENT window, the name registered to the variable (including local variables) can be displayed as alias instead of the variable number.

10010 0 0. 020000	Table	8-5:	S2C396
-------------------	-------	------	--------

Parameter Setting Value	Valid/Invalid
0	Function invalid
1	Function valid

- With this function valid, the confirmation dialog box "Register by name (alias) ?" is displayed when you select the variable on the DETAIL EDIT window.
- 2. Select "YES" and the variable select window appears. Then select the target variable of number and press [ENTER], and the registered name is displayed instead of the variable number. However, if the variable number's name is not yet registered, it is displayed by number as usual.

<Example> Registration of the byte type variable B000 as "WORK KIND" In the case of SET instruction S2C396=0 : SET B000 128 S2C396=1 : SET WORK KIND 128

Select {VARIABLE} from the menu to select each variable and edit the variable name. Up to 16 characters can be entered as a variable name. However, when this function is valid, if the content below is entered, the error message shows and the name cannot be registered. The name already registered · Letters beginning with a number · Letters including the signs below: (,),[,],=,<,>, space, comma Letters beginning with "alphabets representing variables" + "number" <Example> B0..., I0..., BP1..., LEX2... SUPPLE Alphabets representing variables: B, I, D, R, S, P, BP, EX, PX, LB, LI LD, LR, LS, LP, LBP, LEX, LPX When the name begins with " ' ", it is regarded as a comment and the same comment can be registered for two or more variables. In this case, although this function is valid, the number is displayed on the JOB CONTENT window instead of the name. **<Example>** Registration of the byte type variable B001 as "WORKNUM" S2C396=0 : SET B001 10 S2C396=1 : SET B001 10

8 Parameter

8.3 Mode Operation Setting Parameters

A job including 513 or more aliases cannot be saved in or loaded from the external memory device, but the job can be executed.
Examples of cases where saving and loading can be performed:
Registering "OT#(1)" 513 times
Registering "OT#(OUTPUT 1)" for 513 signal numbers
Registering each from "OT#(OUTPUT 1)" to "OT#(OUT-PUT 512)", and registering one B000 without using an alias

Examples of cases where saving and loading cannot be performed:

- Registering each from "OT#(OUTPUT 1)" to "OT#(OUT-PUT 513)"
- Registering each from "OT#(OUTPUT 1)" to "OT#(OUT-PUT 512)", and registering one B000 with using an alias

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

8.3.0.38 S2C397: I/O VARIABLE CUSTOMIZE FUNCTION

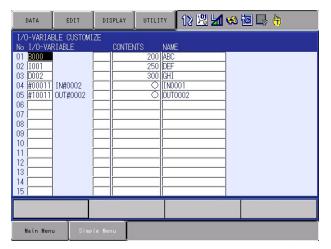

This function enables registration of any particular input/output signal/ variable. Reference and editing of signals/variables are possible on the same window.

Table	8-6:	S2C397

Parameter Setting Value	Valid/Invalid
0	Function Invalid
1	Function Valid

With this function valid, the sub-menu {I/O-VARIABLE CUSTOMIZE} opens under {Main Menu} {ARC WELDING}, {SPOT WELDING}, {GENERAL}, {HANDLING} (differs by application). Select {I/O-VARIABLE CUSTOMIZE}, and the I/O-VARIABLE CUSTOMIZE window appears as follows.

On the I/O-VARIABLE CUSTOMIZE window, any of the input/output signals/variables can be selected and registered (up to 32 items). Registrable signals/variables are as follows:

Table 8-7: Registrable Items on the I/O-VARIABLE CUSTOMIZE Window

Input/Output Signals	USER INPUT SIGNAL USER OUTPUT SIGNAL PSEUDO INPUT SIGNAL
Variables	BYTE TYPE VARIABLE (B VARIABLE) INTEGER TYPE VARIABLE (I VARIABLE) DOUBLE-PRECISION INTEGER TYPE VARIABLE (D VARIABLE)

The contents and names of the registered signals/variables can be checked and edited on this window.

In addition, the data list of registered signals/variables can be loaded, saved, verified or deleted with an external memory unit. Only when this function is valid, "I/O-VARIABLE CUSTOMIZE (file name: USRIOVAR.DAT)" is displayed and can be selected. To display the "I/O-VARIABLE CUSTOMIZE (file name: USRIOVAR.DAT)", select {EX.MEMORY} \rightarrow {LOAD} {SAVE} {VERIFY} {DELETE} \rightarrow {SYSTEM DATA}.

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

8.3.0.39 S2C410: WORD REGISTRATION FUNCTION / WORD EDITING FUNCTION SPECIFICATION

Specifies the valid or invalid to edit the words while inputting the characters.

- 0 : Invalid
- 1 : Valid

Note: It is able to edit the words when the security mode is set to the edit mode or the management mode.

8.3.0.40 S2C413: JOB UNDELETE FUNCTION

This function doesn't completely delete a job from its memory when deleting the job, but saves the data so that the job can be restored as needed.

This parameter can be set on {TEACHING CONDITION} window.

If a job is deleted while this function is valid, the job disappears from the JOB LIST window. In this case, {TRASH JOB LIST} is newly displayed to {JOB} on {Main Menu} and the deleted job is listed on it.

JOB	EDIT DISPLAY	UTILITY 🛛 🕄 🖻 🔛 👘
J OB DOUT MOVE FAIC	JOB	S:0000 TOOL: ***
SPOT WELDING	BELECT JOB	J //OUTPUT01
VARIABLE B001	CREATE NEW JOB	U //INPUTO1
	JOB CAPACITY	
ROBOT	🔁 CTRL MASTER	
SYSTEM INFO	TOYCLE	
	😽 TRASH JOB LIST	
Main Menu	Simple Menu	

The job will not be listed on the trash job list and will not be restored if it is deleted when this function is invalid.

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

On the trash job list, the deleted jobs are displayed.

JOB	EDIT	DISPLAY	UTILITY	12 🖻 🖬 🤘	8 🔞 🗔 🕴)
JOB DOUT MOVE END		H JOB DIR STO1 STO2				
SPOT WELDI	NG					
VARIABLE B001						
SYSTEM INF	o 🛛 GRO	E/TIME :200 JPSET :R1 MENT :	09/07/15 13:	57		
Main Menu	J Sim	ole Menu				

On this window, the following operations are available with the same operations as job list window.

- Batch selection / canceling selection of the jobs
 ({EDIT} → {SELECT ALL} → {CANCEL SELECT})
- Job search ($\{EDIT\} \rightarrow \{JOB \ SEARCH \ COND\}$)
- Rearrange of the jobs in the order of date / order of name ({DISPLAY} → {DATE} {NAME})
- Job detailed information display ({DISPLAY} → {DETAIL})
- Displaying by job groups ({DISPLAY} → {FOLDER})

Restoring the Job

Choose a job to be restored and select {UNDELETE JOB} from {JOB} on the pull down menu.

A dialog box to confirm restoring the selected job.

Undele	ete?
TEST01	
YES	NO

Select "YES" to restore the job. The restored job is deleted from the trash job list and newly listed to the job list.

"NO" to cancel restoring the job.

8 Parameter

8.3 Mode Operation Setting Parameters

Deleting the Job Completely

Delete a job from the memory. The job will not be restored after this operation.

Choose a job to be completely deleted, then select {DELETE JOB} from {JOB} on the pull down menu.

A dialog box to confirm deleting the selected job.

l.)elete?
TEST01	
YES	NO

Select

"YES" to delete the job completely. The deleted job is deleted from the trash job list.

"NO" to cancel deleting the job.

The job data remains until it is completely deleted and the capacity of the memory becomes less as long as this function is valid. Delete unnecessary data to keep enough job capacity.

8.3.0.41 S2C415 to S2C419: TIME RESET

These parameters specify whether resetting operation of the specified times is permitted or not.

- S2C415 : CONTROL POWER ON TIME
- S2C416 : SERVO POWER ON TIME
- S2C417 : PLAYBACK TIME
- S2C418 : WORK TIME
- S2C419 : WEAVING TIME
- 0 : Prohibit Resetting
- 1 : Permit Resetting

"PERMIT" is set as the initial value for the work time and motion time.

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

8.3.0.42 S2C431: TOOL NO. SWITCHING

This parameter specifies whether tool number switching is permitted or not.

- 0 : Prohibited (Only number "0" can be used.)
- 1 : Permitted (64 type of tools from number "0" to "63" can be used.)

8.3.0.43 S2C433: POSITION TEACHING BUZZER

This parameter specifies whether the buzzer sound at position teaching is used or not.

- 0 : With buzzer
- 1 : Without buzzer

8.3.0.44 S2C434: JOB LINKING DESIGNATION (When Twin Synchronous Function Used)

This parameter specifies whether the manipulator at the synchronizing side is to be linked when the manipulator and the station at the synchronized side are performing FWD/BWD or test run, by using the twin synchronous function.

- 0 : Not operating
- 1 : Linking

Fig. 8-7: 0: Does not operate the synchronizing side while teaching the synchronized side.

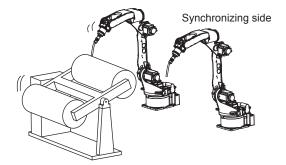

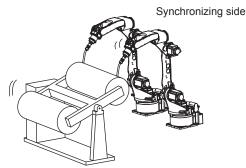

Fig. 8-8: 1: Links the synchronizing side while teaching the synchronized side.

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

8.3.0.45 S2C437: PLAYBACK OPERATION CONTINUATION FUNCTION

This function is used to decide where to resume the playback on the start operation after suspending the playback and moving the cursor or selecting other jobs.

- 0: Starts operation where the cursor is located in the job displayed at the moment.
- 1: The playback continuation window appears. Select "YES" and the playback resumes where the cursor has been located when the playback suspended. If "NO" is selected, the playback resumes where the cursor is located in the job displayed at the moment.

Resumes where the cursor is located in the job displayed at the moment. Resumes where the cursor has been located when the
Resumes where the cursor has been located when the
Acceleration of the cursor has been located when the oblayback suspended OR where the cursor is located in the oblayback suspended at the moment. <example></example> Suspended at step 0003 during the playback of job A ↓ Displays job B ↓ Starts operation ↓ On the playback operation continuation window • When "YES" selected, the playback resumes from step 0003 of job A • When "NO" selected, the playback resumes

Table 8-8: S2C437

Note: When this function is valid (S2C437=1), a light blue cursor is displayed at the instruction section of step where the playback has been stopped. When "YES" is selected, the playback resumes where this cursor is located.

JOB	EDIT	DISPLAY	UTILITY	12	2 🖌 😣 🔟	🕞 (†

	·						
Main ≌enu	Sim	ole Menu					

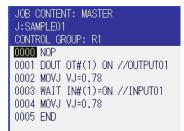

If a job has been edited or FWD/BWD/TEST RUN operation(s) have been executed, the playback cannot resume where it has suspended. Also this function is invalid if the reserved start function is set valid (S2C222=0).

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

8.3.0.46 S2C544: I/O NAME DISPLAY FUNCTION FOR JOB

When a user input/output signal, whose name is already set, is used as a job, this function displays the signal name in the form of a comment.

When the specification of the signal is group specification (IG#, IGH#, OG#, OGH#), the name will not be displayed. Also, the name will not be displayed when the job is saved at external memory devices.

This parameter can be set on {FUNCTION ENABLE}.window.

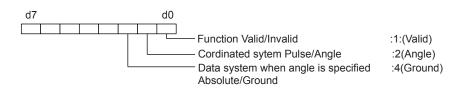

- 0 : Invalid
- 1 : Valid

8.3.0.47 S2C684:ALL AXES ANGLE DISPLAY FUNCTION

This function enables to change the display of manipulator position from pulse-formed to angle-formed on the specific window.

This function is valid in the following windows.

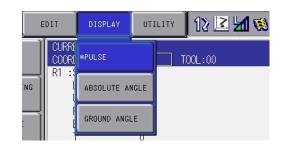

- Current value (however, it is invalid if the present displayed coordinate systems are "base", "robot" or "user".)
- Command position
- Work home position
- · Second work home position

This function can be valid/invalid on {FUNCTION ENABLE} window.

Select {DISPLAY} on the pull down menu while this function is valid, then {PULSE}, {ABSOLUTE ANGLE} and {GROUND ANGLE} appear. Select one so that the presently displayed data can be changed to the selected data type.

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

PULSE

Indicates the pulse data of each axis.

	T POSITION NATE PULSE	1
R1 :S	0	
L	0	
U.	0	
R	0	
В	0	
T	.0	

ABSOLUTE ANGLE

Indicates the independent angle at every axes on the basis that the absolute value is 0[deg] when the pulse is 0.

CURRENT P COORDINAT	OSITION E ABSO.ANGLE
R1 :S	0.0000 deg.
L	0.0000 deg.
U	0.0000 deg.
R	0.0000 deg.
B	0.0000 deg. 0.0000 deg.
	0.0000 deg.

GROUND ANGLE

Indicates the L- and U-axes angle according to the manipulator installation direction. The value of unoperated axes may vary depending on the manipulator's posture.

CURRENT POSITION COORDINATE GND.ANGLE				
R1 :S	0.0000 deg.			
L	90.0000 deg.			
U	0.0000 deg.			
R	0.0000 deg.			
В	0.0000 deg.			
T	0.0000 deg.			

As for the servo track, angle is not indicated but distance (unit [mm]).

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

8.3.0.48 S2C713: CONTROL POINT OPERATION SETTING ON THE SERVO TRACK

This parameter specifies a motion system by which the manipulator's control point is fixed while the servo track is in operation.

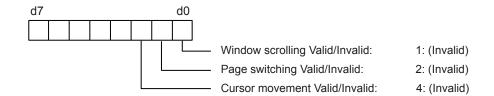

However, it is valid only when the selected control group is specified as a servo track and the servo track is operated by jog keys in the Cartesian coordinates.

- 0 : Normal operation
- 1 : Control point operation setting on the servo track

8.3.0.49 S2C1203: TOUCH OPERATION FUNCTION IN GENERAL-PURPOSE DISPLAY AREA

This parameter specifies whether window scrolling, page switching, and cursor movement by touch operation in the general-purpose display area are enabled or disabled.

The specification is done through the bit specification.

8.3.0.50 S2C1204: CURSOR MOVEMENT FUNCTION BY TOUCH OPERATION ON JOB WINDOW

This parameter specifies the cursor movement operation by touch operation on the job window.

The specification can be done on the {FUNCTION ENABLE SETTING} window.

0: Press [INTERLOCK] + touch operation

1: Touch operation + dialog confirmation

2: Cursor movement by touch operation is not available

Note: S2C1203: When d2 (the cursor movement by the touch operation in the general-purpose display are) is disabled, the cursor cannot be moved.

8.3.0.51 S2C1550: JOB WINDOW REAL NUMBER DATA DISPLAY

This parameter is used to switch the format of the real number data when displayed on the job window and when saving to an external memory device.

1: Exponential notation

0000 NOP		
0001 SET R0	0 1.000000E-01	
0002 END		

0: Decimal notation

- 8 Parameter
- 8.3 Mode Operation Setting Parameters

8.3.0.52 S2C372: ENABLE PATH REVERSE FUNCTION SETTING

This parameter enables and disables the path reverse function.

0: Invalid

1: Valid

Copy the range in which to perform path reverse and store it in a buffer in advance.

- 1. On the JOB CONTENT window, move the cursor to the line immediately before the path reverse position.
- 2. Select {EDIT} on the menu.
 - A pull-down menu appears.

JOB	EDIT	DIS	SPLAY	UTILITY	12	🖻 🏹 👗	1	()
JOB DOUT MOVE	TOP LINE		EDITLOCK CLR (ALL)			S:0003 TOOL: 00	1	
	END LINE SEARCH		COMME CLR(/	ENT OUT ALL)	TOOL: 00			
VARIABL			TAG		002 N			
B001	PASTE				L=0 N			
	REVERSE PA	STE						
	PATH REVER	SE						
SYSTEM II	CHANGE SPEI	ED						
	TRT							
Main Men	Main Menu Simple Menu							

- 3. Select {PATH REVERSE}.
 - On the next cursor line, the buffer contents are inserted in reverse order, the to-and-from speeds are matched, that line number is displayed in reverse, and a confirmation dialog box appears at the same time.
 - Select "YES" and the path reverse is executed and the line number is no longer displayed in reverse.
 - Select "NO" to cancel.

Paste?				
YES	NO			

* For details on path reverse, refer to chapter 3.7 "Editing Jobs".

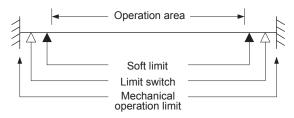

- 8 Parameter
- 8.4 Parameters according to Interference Area

8.4 Parameters according to Interference Area

These parameters limit the P-point maximum envelope of the manipulator or set the interference area for axis interference or cubic interference.

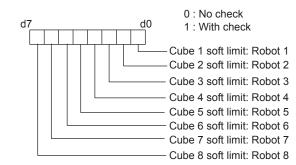

8.4.0.1 S1CxG800 to S1CxG819: PULSE SOFT LIMIT

Soft limit is set independently for each axis by pulse value setting. Set current value (pulse value) of the axis at the soft limit set up position.

8.4.0.2 S2C001: CUBE SOFT LIMIT CHECK

This parameter specifies whether to check the cube soft limit. More than one soft limit can be specified.

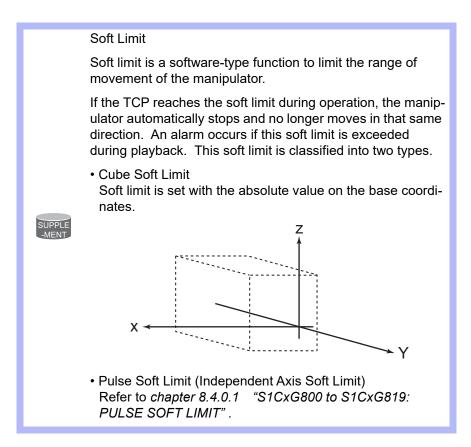

If "WITH CHECK" is selected, set up the following parameters. Units: $\boldsymbol{\mu}\boldsymbol{m}$

Cube Soft Limit (Base Coordinates of Robot TCP)

S3C000: Robot 1: + side: X S3C001: Robot 1: + side: Y S3C002: Robot 1: + side: Z S3C003: Robot 1: - side: X S3C004: Robot 1: - side: Y S3C005: Robot 1: - side: Z S3C006: Robot 2: + side: X S3C007: Robot 2: + side: Y S3C008: Robot 2: + side: Z S3C009: Robot 2: - side: X S3C010: Robot 2: - side: Y S3C011: Robot 2: - side: Z	
•	
•	
S3C042: Robot 8: + side: X S3C043: Robot 8: + side: Y S3C044: Robot 8: + side: Z S3C045: Robot 8: - side: X S3C046: Robot 8: - side: Y S3C047: Robot 8: - side: Z	

- 8 Parameter
- 8.4 Parameters according to Interference Area

8.4.0.3 S2C002: S-AXIS INTERFERENCE CHECK

This parameter specifies whether to check for interference with each manipulator. If "WITH CHECK" is selected, set up the following parameters.

Units: Pulse

S3C048: S-axis Interference Area Robot 1 (+)

S3C049: S-axis Interference Area Robot 1 (-)

S3C050: S-axis Interference Area Robot 2 (+)

S3C051: S-axis Interference Area Robot 2 (-)

S3C063: S-axis Interference Area Robot 8 (-)

- 8 Parameter
- 8.4 Parameters according to Interference Area

8.4.0.4 S2C003 to S2C066: CUBE/AXIS INTERFERENCE CHECK

- Designation of checking These parameters specify the cube/axis interference to be used by bit.
 Cube Interference/Axis Interference Not Used
 Robot 1
 Robot 2
 Robot 8
 Base Axis 1
 - 10 : Base Axis 2

.....

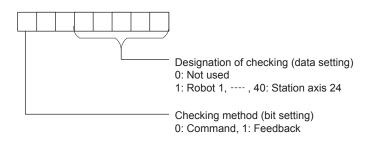

- 16 : Base Axis 8
- 17 : Station Axis 1
- 18 : Station Axis 2
-

SUPPLE

40 : Station Axis 24

2. Checking method

Designates whether checking is performed by command or feedback.

Checking method

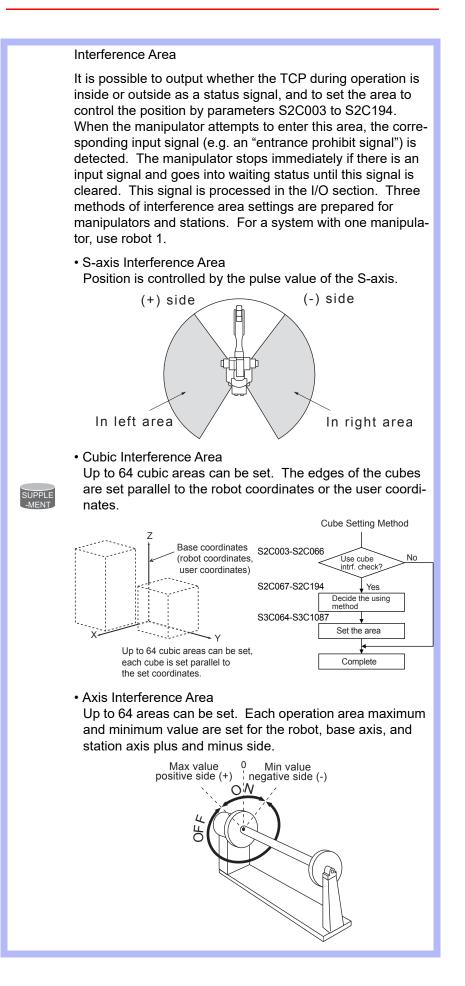

The checking method differs according to ON/OFF status of servo power supply.

	Checking Method Designation	Servo Power Supply ON	Servo Power Supply OFF
Γ	Command	Command	Feedback
Γ	Feedback	Feedback	Feedback

During the servo float function operation, checking is performed by feedback regardless of the checking method designation.

8 Parameter

8.4 Parameters according to Interference Area

- 8 Parameter
- 8.4 Parameters according to Interference Area

8.4.0.5 S2C067 to S2C194: CUBE INTERFERENCE/AXIS INTERFERENCE SIGNAL USING METHOD

For each interference signal, the reference coordinate system for the interference area can be specified by the type and number of the coordinate system.

S2C067: Cube/axis interference signal 1 Type of the coordinate system S2C068: Cube/axis interference signal 1 Number of the coordinate system S2C069: Cube/axis interference signal 2 Type of the coordinate system S2C070: Cube/axis interference signal 2 Number of the coordinate system

- S2C194: Cube/axis interference signal 64 Number of the coordinate system
- 1. Type of the coordinate system

Specify the reference coordinate system for the interference area.

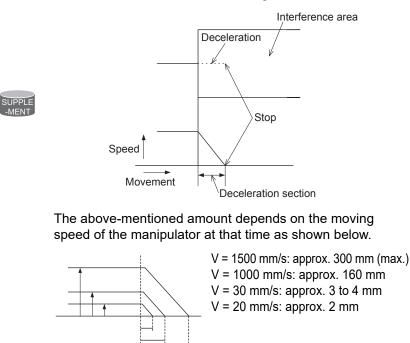

- 0 : Pulse (axis interference)
- 1 : Base coordinates (cube interference)
- 2 : Robot coordinates (cube interference)
- 3 : User coordinates (cube interference)
- 2. Number of the coordinate system

When "3: User coordinates" is specified for the type of the coordinate system, specify the number of the user coordinates here.

Precaution When Setting the Interference Area

The following must be considered in advance when setting the area for the cube/axis interference or the S-axis interference.

The manipulator is decelerated to stop from the point where it enters in the area, and the actual point where the manipulator stops is inside the area. Thus, set the area in consideration of the amount of the manipulator movement in the deceleration section shown in the figure below.

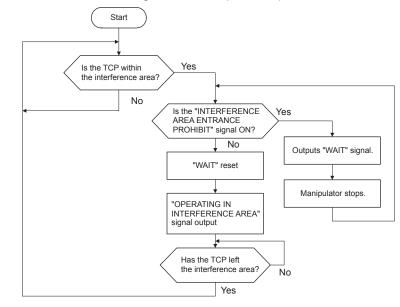

8 Parameter

8.4 Parameters according to Interference Area

Interference Prevention in Interference Area

SUPPLE

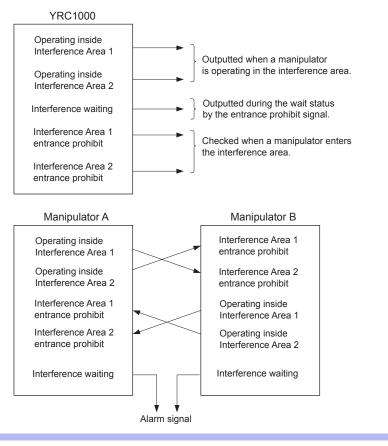

Processing to prevent interference is executed in the I/O processing section. The relation between the YRC1000 I/O signal and manipulator operation is shown below.

If the status becomes the wait status by the entrance prohibit signal, the manipulator enters the area just a little bit because of the deceleration process, and then stops.

The manipulator does not enter the interference area where the entrance prohibit signal is already valid.

Fig. 8-9: Connection Example Where Two Manipulators Are Operated in the Same Area

- 8 Parameter
- 8.4 Parameters according to Interference Area

8.4.0.6 S3C000 to S3C047: CUBE SOFT LIMIT

These parameters specify auxiliary functions of S2C001 parameter. For details, see *chapter 8.4.0.2* "S2C001: CUBE SOFT LIMIT CHECK".

8.4.0.7 S3C048 to S3C063: S-AXIS INTERFERENCE AREA

These parameters specify auxiliary functions of S2C002 parameter. For details, see *chapter 8.4.0.3 "S2C002: S-AXIS INTERFERENCE CHECK"*.

8.4.0.8 S3C064 to S3C1087: CUBIC INTERFERENCE AREA

These parameters specify auxiliary functions of S2C003 to S2C066 parameters. For details, see *chapter 8.4.0.4 "S2C003 to S2C066: CUBE/AXIS INTERFERENCE CHECK"*.

8.4.0.9 S3C1089 to S3C1096: ROBOT INTERFERENCE AREA

These parameters specify auxiliary functions of S2C236 to S2C263 parameters. For details, see *chapter 8.4.0.6 "S3C000 to S3C047: CUBE SOFT LIMIT"*.

8.4.0.10 S3C1097: A SIDE LENGTH OF WORK-HOME-POSITION CUBE

Units: 1µm

This parameter specifies a side length of the cube for the work home position.

- 8 Parameter
- 8.5 Parameters according to Status I/O

8.5 Parameters according to Status I/O

These parameters set the parity check or I/O setting for user input/output signals.

8.5.0.1 S2C235: USER OUTPUT RELAY WHEN CONTROL POWER IS ON

This parameter specifies the state of the user output relays when the control power is turned ON. Since the power OFF state, including peripheral devices, cannot be completely reproduced, take note when restarting.

- 0 : Reset to the power OFF state
- 1 : Initialized (all user relays OFF)

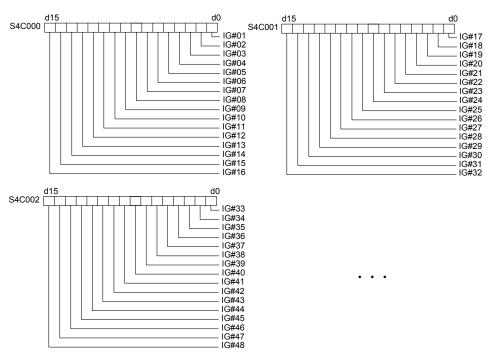

8.5.0.2 S4C000 to S4C015, S4C1100 to S4C1115: PARITY OF USER INPUT GROUPS

These parameters specify whether to execute parity checks with parameters when instructions covering the input group (1G#) are executed. The instructions covering the input groups are as shown below.

- IF Sentence (JUMP, CALL, RET, PAUSE)
- Pattern Jump, Pattern Job Call
- DIN
- WAIT

A parity check is performed against the input group where a bit-ON (1) was done by this parameter.

S4C000 to S4C015	:	IG#(1) to IG#(256)
S4C1100 to S4C1115	:	IG#(257) to IG#(512)

Parity bits are set as the highest level bits of each input group and are written in even parity. If an error is detected during parity check, an alarm occurs and the manipulator stops. Remains unchanged if no parity check is specified.

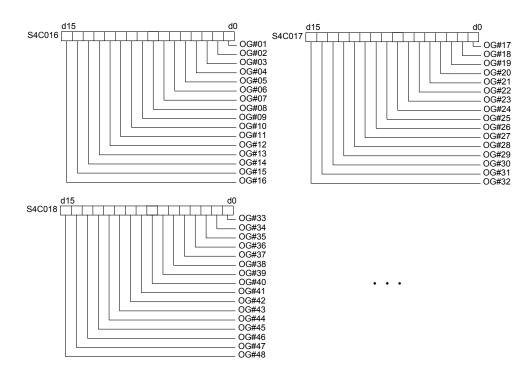

- 8 Parameter
- 8.5 Parameters according to Status I/O

8.5.0.3 S4C016 to S4C031, S4C1116 to S4C1131: PARITY OF USER OUTPUT GROUPS

These parameters specify whether the output group instruction is executed with parity check (even parity).

A parity check is performed against the output group where a bit-ON (1) was done by this parameter.

S4C016 to S4C031	: OG#(1) to OG#(256)
S4C1116 to S4C1131	: OG#(257) to OG#(512)

Parity bits are set as the highest level bits of each output group. For example, if OG#01 is specified with parity and DOUT OG# (1) 2 is executed, the result will be 00000010 if 2 is binary converted. Since there will be only one bit (odd) ON at this time, the parity bit (highest level bit) will be set to ON and 10000010 (130) will be output to OG# (1).

As in the case of a variable such as DOUT OG# (1) B003 parity bits are added to the contents of the variable data. However, if the contents of the variable exceed 127, as in the case of DOUT OG# (1) 128, an alarm will occur. Remains unchanged if no parity check is specified.

- 8 Parameter
- 8.5 Parameters according to Status I/O

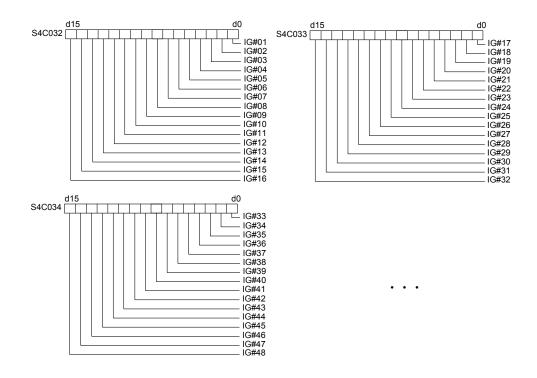

8.5.0.4 S4C032 to S4C047, S4C1132 to S4C1147: DATA OF USER INPUT GROUPS

These parameters specify whether to handle the input group data as binary data or as BCD data when an instruction for the input group (1G#) is executed. The instructions covering the input groups are as shown below.

- IF Sentence (JUMP, CALL, RET, PAUSE)
- Pattern Jump, Pattern Job Call
- DIN
- WAIT

The input group where a bit-ON (1) was done by this parameter is treated as BCD data.

S4C032 to S4C047	: IG#(1) to IG#(256)
S4C1100 to S4C1115	: IG#(257) to IG#(512)

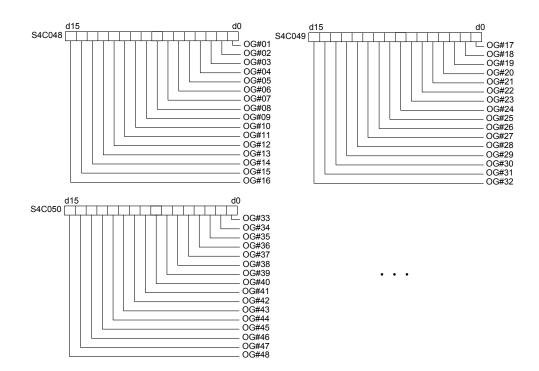

- 8 Parameter
- 8.5 Parameters according to Status I/O

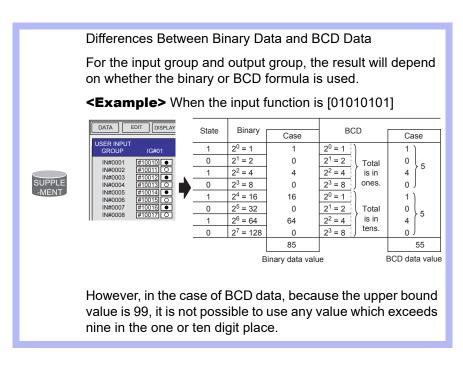

8.5.0.5 S4C048 to S4C063, S4C1148 to S4C1163: DATA OF USER OUTPUT GROUPS

These parameters specify whether the output group instruction is executed with binary data or BCD data.

The output group where a bit-ON (1) was done by this parameter is treated as BCD data.

 S4C048 to S4C063
 : OG#(1) to OG#(256)
 S4C1148 to S4C1163
 : OG#(257) to OG#(512)

8 Parameter

8.5 Parameters according to Status I/O

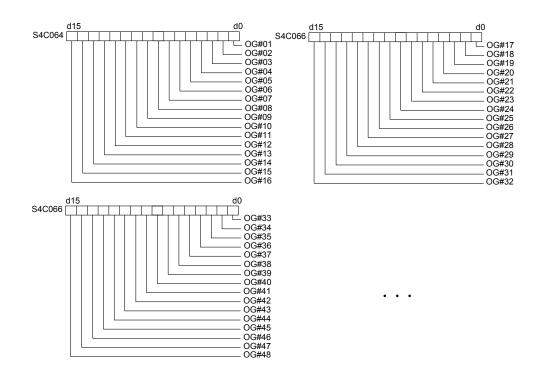

8.5.0.6 S4C064 to S4C079, S4C1164 to S4C1179: USER OUTPUT GROUP TO BE INITIALIZED AT SWITCHING MODE

Set the user output group with bit to be initialized at switching mode.

Use these parameters when using universal output signals as work instructions for peripheral devices.

The signal of the output group where the bit-on (1) is done by this parameter will be turned OFF at mode switching.

S4C064 to S4C079	: OG#(1) to OG#(256)
S4C1164 to S4C1179	: OG#(257) to OG#(512)

8.5.0.7 S4C240: USER OUTPUT NO. WHEN MANIPULATOR DROP ALLOWABLE RANGE ERROR OCCURS

This parameter specifies the user output number to output the manipulator drop allowable range error alarm occurrence externally.

When this function is not used, set "0".

- 8 Parameter
- 8.6 Parameters according to Coordinated or Synchronized Operation

8.6 Parameters according to Coordinated or Synchronized Operation

These parameters make the settings for coordinated or synchronized operations between manipulators or between manipulators and stations.

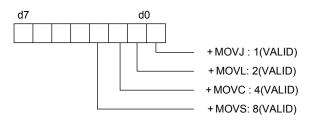

8.6.0.1 S2C212: +MOV or +SMOV INSTRUCTION SPEED INPUT

This parameter specifies whether the speed inputting for move instructions of the master robot in a coordinated job is permitted or not.

<Example> 0: Not Provided SMOVL V=100 +MOVL ← Master side Speed specification not provided <Example> 1: Provided SMOV L V=100 +MOV L V=100 ← Master side Speed specification \wedge provided

8.6.0.2 S2C213: +MOV INSTRUCTION INTERPOLATION INPUT

This parameter specifies which interpolation is permitted for move instructions for the master robot in a coordinated job. More than one instruction can be specified.

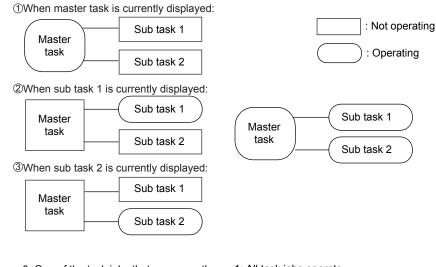

- 8 Parameter
- 8.6 Parameters according to Coordinated or Synchronized Operation

8.6.0.3 S2C231: OPERATION METHOD AT FWD/BWD OPERATION OR TEST RUN BY INDEPENDENT CONTROL

This parameter specifies the operation method at FWD/BWD operation or test run by independent control.

- 0 : The job of the task that is currently displayed operates.
- 1 : Jobs of all the tasks operate.

0: One of the task jobs that are currently displayed operates.

1: All task jobs operate.

8.6.0.4 S2C232: JOB AT CALLING MASTER OF SUBTASK BY INDEPENDENT CONTROL

This parameter specifies the job which is called up when the master of the subtask is called up by independent control.

- 0 : Master job
- 1 : Root job

Master Job: Job registered in the master control window

Root Job: Job activated by PSTART instruction

8.6.0.5 S2C264: STATION AXIS CURRENT VALUE DISPLAY FUNCTION

This parameter specifies whether the function to display the current value of the station axis in the following units is valid/invalid.

- 0 : Invalid
- 1 : Valid

Rotary axis: Angle (deg) Servo track: Distance (mm)

Regarding whether to specify the rotary axis or the servo track, refer to *chapter 8.6.0.6* "S2C265 to S2C288: STATION AXIS DISPLAYED UNIT".

- 8 Parameter
- 8.6 Parameters according to Coordinated or Synchronized Operation

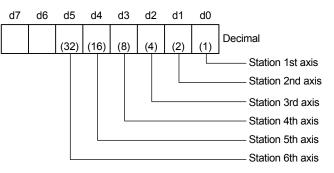

8.6.0.6 S2C265 to S2C288: STATION AXIS DISPLAYED UNIT

This parameter specifies the station axis displayed unit (bit specification).

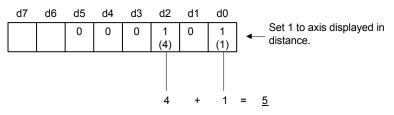

- 0 : Display angle (deg)
- 1 : Display in distance (mm)

Setting Method

Set a numerical value (decimal) where the bit of the axis to be displayed in the units of distance becomes 1.

<Example> When 1st and 3rd axes of station 1 are displayed in the units of distance:

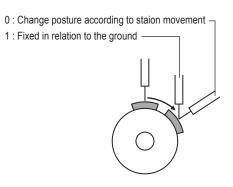

Therefore, set parameter S2C265 of station 1 to 5.

8.6.0.7 S2C420: POSTURE CONTROL OF SYNCHRONIZED MANIPULATOR (When Twin Synchronous Function Used)

This parameter specifies the posture control method for synchronized manipulator performing compensation during playback by using the twin synchronous function.

- 0 : Change posture according to station movement
- 1 : Fixed in relation to the ground

- 8 Parameter
- 8.6 Parameters according to Coordinated or Synchronized Operation

8.6.0.8 S2C421: POSTURE CONTROL OF MANIPULATOR IN MULTI-JOB (When Twin Synchronous Function Used)

This parameter specifies the posture control method for manipulator executing compensation at the linking side when job linking is performed during FWD/BWD operation by the twin synchronous function.

- 0 : Change posture according to station movement
- 1 : Fixed in relation to the ground

8.6.0.9 S2C687: OPERATION OF JOB WITHOUT CONTROL GROUP SPECIFICATION

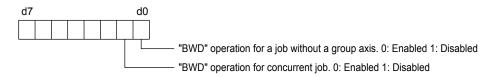

When the servo power supply is individually turned OFF where jobs in multiple number of tasks are operated using the independent control function, the job execution of the control group whose servo power supply is turned OFF is interrupted. The jobs of other control groups continue their execution.

For the jobs without control group specification such as master job, the conditions for execution can be set by the parameter.

- 0 : Execution possible only when servo power supply to all the axes have been turned ON.
- 1 : Execution possible when servo power supply to any axis is turned ON.

8.6.0.10 S2C688: EXECUTION OF "BWD" OPERATION

This parameter prohibits step-back operation of a job without a step.

8 Parameter

0

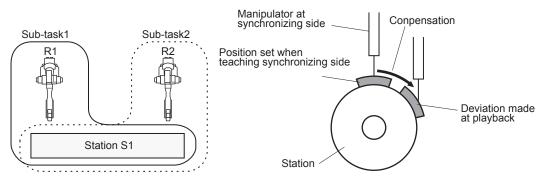

8.6 Parameters according to Coordinated or Synchronized Operation

8.6.0.11 S3C1101: MAXIMUM DEVIATION ANGLE OF CURRENT STATION POSITION (When Twin Synchronous Function Used)

Used when the twin synchronous function is used. This parameter specifies the maximum deviation between the teaching position and the current station position.

: No deviation check

Other than 0 : Deviation angle (units: 0.1°)

In the above figure on the left, the follower R2 executes the job of subtask 2 in synchronization with the motion of the station axis which is moved by the R1 job. In this procedure, the job of subtask 2 controls only the R2 robot axis.

If the teaching position of the station in the subtask 2 differs from the station current position (controlled by the subtask 1 job), the difference is automatically offset so that R2 keeps the taught position in relation to the station.

Difference between the taught and the station current positions is always monitored. If the difference exceeds a set value of the parameter, the message "PULSE LIMIT (TWIN COORDINATED)" appears.

- 8 Parameter
- 8.7 Parameters for Other Functions or Applications

8.7 Parameters for Other Functions or Applications

These parameters make the settings for other functions or applications.

8.7.0.1 S1CxG049 to S1CxG051: SMALL CIRCLE CUTTING

These parameters prescribe cutting operation at small circle cutting.

S1CxG049 (Minimum diameter)	:	Set the minimum diameter of a figure in the units of μm that can be processed by small-circle cutting machine.
S1CxG050 (Maximum diameter)	:	Set the maximum diameter of a figure in the units of μm that can be processed by small-circle cutting machine.
S1CxG051 (Maximum speed)	:	Set the maximum cutting speed at operation by CUT instruction in the units of 0.1mm/s.

8.7.0.2 S1CxG052 to S1CxG053: SMALL CIRCLE CUTTING DIRECTION LIMIT VALUE

These parameters set the cutting direction limits at small circle cutting.

S1CxG052 (+ direction)	:	Set the limit value in the positive direction of cutting angle DIR set by CUT instruction, in the units of 0.01°.
S1CxG053 (- direction)	:	Set the limit value in the negative direction of cutting angle DIR set by CUT instruction, in the units of 0.01° .

8.7.0.3 S1CxG054 to S1CxG055: SMALL CIRCLE CUTTING OVERLAP VALUE

These parameters set the overlapped value at small circle cutting.

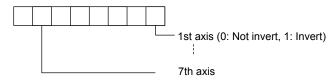

S1CxG054 (Operation radius)	:	Set the operation radius at inner rotation in the units of 1 μ m after overlapping by CUT instruction.
S1CxG055 (Rotation angle)	:	Set the rotation angle at inner rotation in the units of 0.1° after overlapping by CUT instruction.

8.7.0.4 S1CxG063, S1CxG064: PATTERN CUTTING DIMENSION

These parameters set the minimum diameter (S1CxG063) and the maximum diameter (S1CxG064) for the pattern cutting in units of μ m.

8.7.0.5 S1CxG065: MIRROR SHIFT SIGN INVERSION

This parameter sets which axis to be shifted (mirror-shift: invert the sign).

- 8 Parameter
- 8.7 Parameters for Other Functions or Applications

8.7.0.6 S1CxG120: SPEED CALCULATION METHOD FOR ANALOG OUTPUT CORRESPONDING TO SPEED

This parameter sets the output method for analog output during weaving for the function of analog output corresponding to speed.

- 0: Actual path speed calculation (Default)
- 1: Advancing direction speed calculation (Weaving correction amount is removed)

8.7.0.7 S2C430: RELATIVE JOB OPERATION METHOD

This parameter specifies how to determine how the relative job moves when it is run.

This specifies the conversion method for converting a relative job to a standard job (pulse job) and the conversion method for calculating the target position (pulse position) when operating a relative job.

8.7.0.8 S2C439: PARALLEL SHIFT OPERATION METHOD

This parameter specifies how to determine how movement is performed when the parallel shift function is used.

This specifies the conversion method when using the parallel shift job conversion function and the conversion method when calculating the target position (pulse position) after shifting by the parallel shift function.

- 0: Previous step with priority (B-axis moving distance minimized)
- 1: Form with priority
- 2: Previous step with priority (R-axis moving distance minimized)
- 4: Previous step with priority (R-axis moving distance minimized and pulse limit avoided)

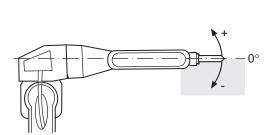

S2C430 and S2C439 setting values

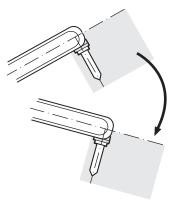

• Setting value [0]: Previous step with priority (B-axis moving distance minimized)

This is a method of moving to a specified step while keeping a correlation with the previous step.

Movement is performed without changing the sign (+/-) of the B-axis angle.

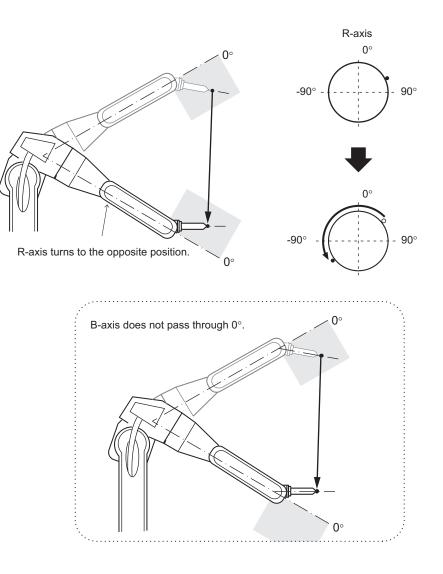

Therefore, this can be used in jobs where the B-axis does not pass through 0° .

- 8 Parameter
- 8.7 Parameters for Other Functions or Applications

If you execute a job where the B-axis passes through 0° , even though the sign of the B axis is supposed to change, it is controlled not to change, and so this will result in the R-axis being in a position that is 180° opposite.

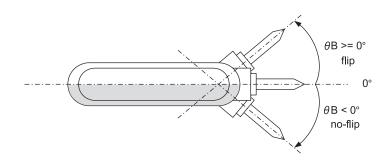

Perform teaching so that the B-axis does not pass through 0° between steps.

- When converting from a standard job to a relative job
- When using the shift function
- When using the parallel shift job conversion function to convert the job

- 8 Parameter
- 8.7 Parameters for Other Functions or Applications
 - Setting value [1]: Form with priority

The control method of form with priority is used to move so that the form is added to the position data.

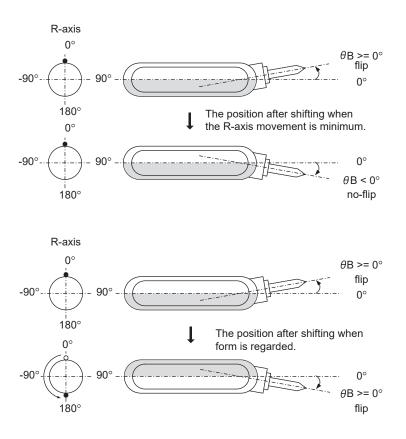

If the teaching position is shifted while near the pole changing point of the form, it may not be possible to operate in the specified form.

For example, shifting a job taught with a B-axis angle near 0° ($\theta B \ge 0^{\circ}$) may result in a B-axis angle greater than 0° ($\theta B < 0^{\circ}$).

Before the shift is a flip, and after the shift is a no-flip.

When form with priority is used, the R-axis angle will move to a different angle by 180° because it operates in the specified form even in such a case.

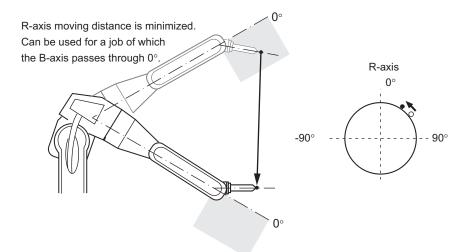

Therefore, the R-axis moves in the direction 180° opposite to the taught position, which could result in interference with the workpiece or other objects. Note that the coordinate system position and orientation of the final TCP will be the same before and after the shift.

- 8 Parameter
- 8.7 Parameters for Other Functions or Applications
 - Setting value [2]: Previous step with priority (R-axis moving distance minimized)

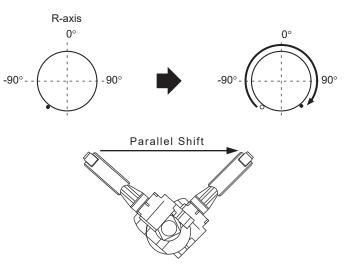

This is a method to minimize the R-axis moving distance from the previous step to the next step. Therefore, this can be used in jobs where the B-axis passes through 0° .

This method performs control to minimize the Raxis moving distance, and so to perform significant movement of the R-axis, add a step in the middle of the movement.

If the shift amount is large, the R-axis may need to be rotated significantly.

In these types of cases, this method cannot be used, and so use "Previous step with priority (B-axis moving distance minimized)".

8 Parameter

JO-

8.7 Parameters for Other Functions or Applications

Perform teaching so that the R-axis moving distance between steps does not exceed 90°

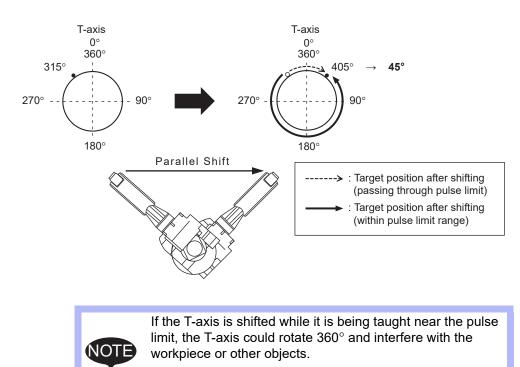

To perform operations that exceed 90° , add steps in the middle of the movement.

- When converting from a standard job to a relative job
- When using the shift function
- When using the parallel shift job conversion function to convert the job
- Setting value [4]: Previous step with priority (R-axis moving distance minimized and pulse limit avoided)

In the same way as setting the previous step with priority (R-axis moving distance minimized), operation is performed so that the R-axis moving distance from the previous step to the next step is minimized.

Additionally, if the target position exceeds the Taxis pulse limit, operation is automatically performed to a position within the pulse limit range.

For example, when the T-axis pulse limit is set to $\pm 360^{\circ}$, if a step with a teaching position of 315° on the T-axis is shifted in parallel and the target position of the T-axis becomes 405° , the target position of the T-axis is converted to 45° , which is a position within the pulse limit range.

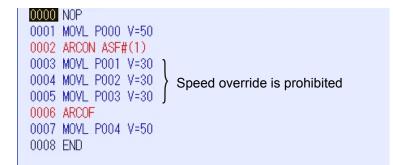

In this case, do not set previous step with priority (R-axis moving distance minimized and pulse limit avoided).

- 8 Parameter
- 8.7 Parameters for Other Functions or Applications

8.7.0.9 S2C1135: PROHIBIT WELDING SECTION SPEED OVERRIDE

This parameter prohibits the speed override within the welding section. While the manipulator is in the welding section, it moves at the same speed as in the situation where the speed override is not specified.

- 0 : Invalid
- 1 : Valid

8.7.0.10 S2C1137: DISPLAY WELDING CONDITION FILE COMMENT ON THE JOB WINDOW FUNCTION

This parameter specifies a comment to the welding start condition file or the welding end condition file, and then displays the comment on the job window when teaching the file by ARCON, ARCOF or ARCSET instruction.

- 0 : Invalid
- 1 : Valid

00000 NOP 0001 MOVL P000 V=50 0002 ARCON ASF#(1) //Current200A Voltage10V 0003 MOVL P001 V=30 0004 MOVL P002 V=30 0005 MOVL P003 V=30 0006 ARCOF 0007 MOVL P004 V=50 0008 END

8.7.0.11 S3C1111 to S3C1190: ANALOG OUTPUT FILTER CONSTANT

(When analog output corresponding to speed function is used)

By setting a constant to filter, a filter processing can be performed for the output analog signal.

8.7.0.12 S3C1191: CUT WIDTH CORRECTION VALUE

(When form cutting function is used)

This parameter specifies the path correction value for pattern cutting operation. A value 1/2 of the cut width is set in units of μ m.

- 8 Parameter
- 8.8 Hardware Control Parameters

8.8 Hardware Control Parameters

These parameters make the hardware settings for fan alarm or relay operation, etc.

8.8.0.1 S2C646: ANTICIPATION FUNCTION

This parameter specifies anticipation output.

- 0 : Invalid
- 1 : Valid

The anticipation function is a function to quicken or slow the ON/OFF timing of 32 universal output signals and 16 user output groups.

For details of the ANTOUT instruction, refer to "YRC1000 OPTIONS INSTRUCTIONS FOR INFORM LANGUAGE (RE-CKI-A466) 2.1 I/O Instructions: ANTOUT". Using this function, signal output can be carried out before or after the step is reached. As a result, timing deviation due to delayed motion of peripheral devices and robot motion can be adjusted.

Setting the time to a negative value (-) advances the signal output.

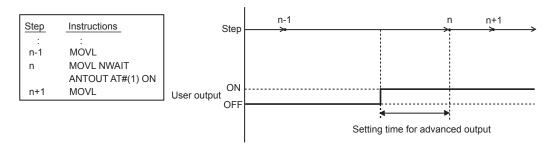

This setting is effective when adjusting timing deviation due to delayed motion of peripheral devices.

Setting the time to a positive value (+) delays the signal output.

This setting is effective when adjusting timing deviation due to delayed robot motion.

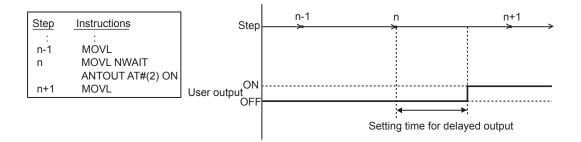

<Advanced Signal Output>

Signal output is carried out before the step is reached.

<Delayed Signal Output>

Signal output is carried out after the step is reached.

- 8 Parameter
- 8.8 Hardware Control Parameters

8.8.0.2 S4C327 to S4C390: SETTING OF OPERATING RELAY NO.

Up to 64 output signals can be turned ON/OFF with the programming pendant. The object relay No. is set in these parameters. Although it is possible to set optional values for output No. 1 to 4096 in the parameters, the following must be taken into consideration.

- Avoid setting duplicate numbers.
- The signal turned ON or OFF with the programming pendant is operated again or remains unchanged until the instruction is executed.

8.8.0.3 S4C391 to S4C454: OPERATING METHOD OF RELAYS

These parameters specify the operating method of output signals by the programming pendant. The operating method can be specified for each output signal.

Parameter Setting Value	Operation of Output Signal	
0	⁺ ON <u>-</u> o ⁻ o- ON <u>-</u> OFF <u>-</u> o ⁻ o- OFF	
1	+ON ON/OFF with the key ON while the key is pressed OFF if the key is not pressed	—ото— ON —ото— OFF

8.8.0.4 S2C786 to S2C788: COOLING FAN ALARM DETECTION

This parameter specifies a detection display for cooling fan 1 to 3 with alarm sensor, connected to power ON unit.

- 0 : No detection
- 1 : Detected with message display
- 2 : Detected with message and alarm display

8.8.0.5 S2C1170: COOLING FAN ALARM DETECTION

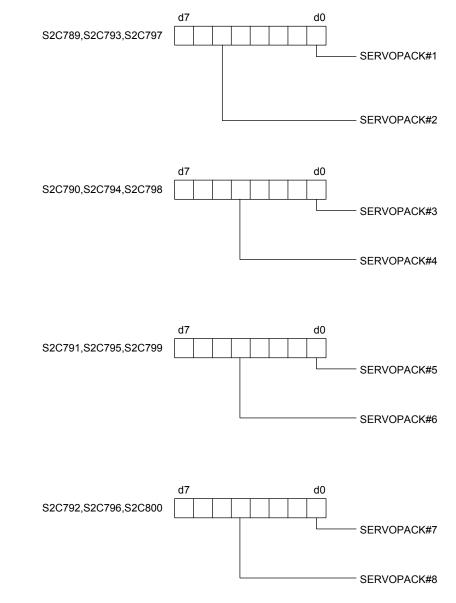

This parameter specifies a detection display for cooling fan 4 to 5 with alarm sensor, connected to power ON unit.

- 0 : No detection
- 1 : Detected with message display
- 2 : Detected with message and alarm display

- 8 Parameter
- 8.8 Hardware Control Parameters
- 8.8.0.6 S2C789 to S2C792: COOLING FAN ALARM 1 OPERATION
- 8.8.0.7 S2C793 to S2C796: COOLING FAN ALARM 2 OPERATION
- 8.8.0.8 S2C797 to S2C800: COOLING FAN ALARM 3 OPERATION

These parameters specify the operation of cooling fan 1 to 3 with alarm sensor, connected to power ON unit.

Each bit specifies the power ON unit to which the detecting sensor is connected.

8.8.0.9 S2C1174: COOLING FAN ALARM 4 OPERATION

These parameters specify the operation of the cooling fan 4 with an alarm sensor, connected to the power supply contactor unit.

- 8 Parameter
- 8.8 Hardware Control Parameters

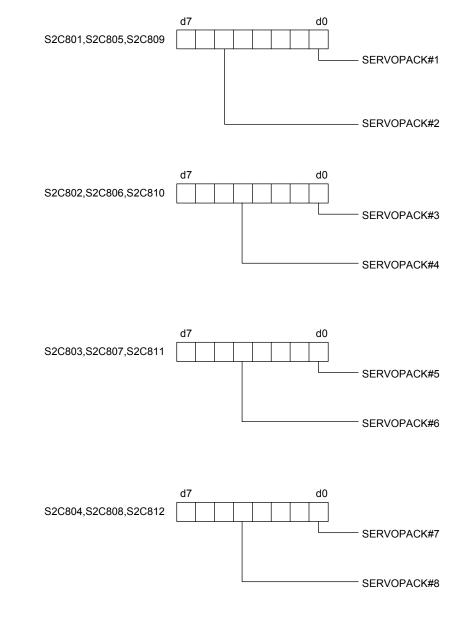

8.8.0.10 S2C801 to S2C804: FAN ALARM 1 WELDER STATUS

8.8.0.11 S2C805 to S2C808: FAN ALARM 2 WELDER STATUS

8.8.0.12 S2C809 to S2C812: FAN ALARM 3 WELDER STATUS

These parameters specify the power status that detects a fan alarm.

- 0 : Detect during control power ON
- 1 : Detect during servo power ON

8.8.0.13 S2C1178: FAN ALARM 4 WELDER STATUS

This parameter specifies the power status that detects a fan alarm.

- 0 : Detect during control power ON
- 1 : Detect during servo power ON

- 8 Parameter
- 8.9 Transmission Parameters

8.9 Transmission Parameters

These parameters are used when the optional FC1, FC2, or data transmission function is used.

For details, refer to the optional manual "YRC1000 OPTIONS INSTRUCTIONS FOR DATA TRANSMISSION FUNCTION (HW1484044)".

8.10 Application Parameters

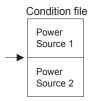

8.10.1 Arc Welding

8.10.1.1 AxP000: APPLICATION

This parameter specifies the application. Set "0" for arc welding.

8.10.1.2 AxP003: WELDING ASSIGNMENT OF WELDING START CONDITION FILE

This parameter specifies the beginning condition number in the welding start condition file to be assigned to the power source 2. Condition files of a lower number are automatically assigned to the power source 1. For a system with one power source, set "49" (maximum value).

8.10.1.3 AxP004: WELDING ASSIGNMENT OF WELDING END CONDITION FILES

This parameter specifies the beginning condition number in the welding END condition file to be assigned to the power source 2. Condition files of a lower number are automatically assigned to the power source 1. For a system with one power source, set "13" (maximum value).

Power Source 1	
Power Source 2	

8.10.1.4 AxP005: WELDING SPEED PRIORITY

This parameter specifies whether the welding speed is specified by the "ARCON" instruction, by the welding start condition file, or by the additional times of the "MOV" instruction.

8.10.1.5 AxP009: WORK CONTINUING

This parameter specifies whether to output an "ARCON" instruction to restart after the manipulator stopped while the "ARCON" instruction is being output.

8.10.1.6 AxP010: WELDING INSTRUCTION OUTPUT

This parameter specifies the beginning number (0 to 12) of the analog output channel to the power source. "0" indicates that no power source exists.

- 8 Parameter
- 8.10 Application Parameters

8.10.1.7 AxP011, AxP012: MANUAL WIRE OPERATION SPEED

These parameters specify the manual wire operation speed as a percentage of the maximum instruction value. Instruction polarity is determined by the current instruction in the power source condition file. The setting range is from 0 to 100.

8.10.1.8 AxP013, AxP014: WELDING CONTROL TIME

These parameters specify the welding control time in units of minutes. The setting range is from 0 to 999.

8.10.1.9 AxP015 to AxP017: NUMBER OF WELDING CONTROL

These parameters specify the number of welding controls. The setting range is from 0 to 99.

8.10.1.10 AxP026 to AxP029: TOOL ON/OFF USER OUTPUT NO. (Jigless System)

These parameters specify the user output number for the tool open/close operation by specific keys.

8.10.2 Handling Application

8.10.2.1 AxP002, AxP004: f1 KEY FUNCTION

These parameters set the output signal to assign for f1 key.

- 0: Not specified
- 1 to 4: Specific outputs for HAND-1 to HAND4-1
- 5: User output (No. is specified by AxP004)

8.10.2.2 AxP003, AxP005: f2 KEY FUNCTION

These parameters set the output signal to assign for f2 key.

- 0: Not specified
- 1 to 4: Specific outputs for HAND-2 to HAND4-2
- 5: User output (No. is specified by AxP005)

8.10.3 Spot Welding

8.10.3.1 AxP003: MAXIMUM NUMBER OF CONNECTED WELDING POWER SOURCE

This parameter specify the maximum number of power sources to be used. The value is automatically set at start-up. No modification is needed.

8.10.3.2 AxP004: GUN FULL OPEN STROKE ON/OFF SIGNAL

This parameter specifies which stroke switching signal is output ON or OFF to make the gun fully-opened for each gun.

Bit specification (1 for 01) for 8 guns. The initial setting is "0".

0 0 0 0 0 0 0 0 | | | | | | | | 8 7 6 5 4 3 2 1 Gun number

- 8 Parameter
- 8.10 Application Parameters

8.10.3.3 AxP005: STROKE CHANGE ANSWER TIME LIMIT

When using the X2 gear mechanical stopper gun and switching gun stroke, this parameter sets the time from the stroke-switching-sequence start until the pressure instruction end.

The initial setting is "0", with which the switching signal is output for the "stopper-type stroke switching time" set in the file, and then the gun pressure instruction is turned OFF.

8.10.3.4 AxP006: PARITY SPECIFICATION FOR WELDING CONDITIONS

When adding the parity signal to the welding condition signal with the power source connected to each welding gun, this parameter specifies odd or even parity.

Bit specification for 4 power sources. (0: odd number, 1: even number) The initial setting is "0".

00000000

4 3 2 1 Welding power source number

8.10.3.5 AxP007: ANTICIPATION TIME

When executing the GUNCL or SPOT instruction with NWAIT specified in the previous move instruction but the time is not specified by ATT in the GUNCL or SPOT instruction, this parameter specifies the anticipation condition (time). The initial setting is "0", with which the each instruction is executed as soon as the taught position of the previous move instruction is reached, as normal operation.

8.10.3.6 AxP015: WELDING ERROR RESET OUTPUT TIME

This parameter sets the output time of the welding error reset signal to the Welder when the alarm reset signal is input.

If the setting is "0", the welding error reset signal is not output to the power source even if the alarm reset signal is input.

8.10.3.7 AxP016, AxP017: TIP WEAR AMOUNT ALARM VALUE

These parameters set the tip wear amount alarm values (AxP016: movable side, AxP017: fixed side) at the wear detection.

8.10.4 General-Purpose Application

8.10.4.1 AxP009: WORK CONTINUE PROHIBIT

This parameter specifies whether to output TOOLON instruction or not at restarting when the work is stopped for some reasons during the output of TOOLON instruction.

9 Table of Basic Instructions

9.1 Move Instructions

REFP Function		Defines a reference point (e.g. wall point for weaving).		
	Additional Item	<reference number="" point=""></reference>	wall point 1 for weaving: 1 wall point 2 for weaving: 2	
		Position data, Base axis position data, Station axis position data		
	Example	REFP 1 P000		
SPEED	Function	Sets play speed.		
	Additional Item	VJ= <joint speed="">, V=<tcp speed="">, VR=<play of="" posture="" speed="" the="">, VE=<play axis="" external="" of="" speed=""></play></play></tcp></joint>	VJ:Same as MOVJ. V,VR,VE: Same as MOVL.	
	Example	SPEED VJ=50.00	L	

- Enable signal
- Switching the mode
- Enable Switch

- 9 Table of Basic Instructions
- 9.2 I/O Instructions

9.2 I/O Instructions

	Function	Turns the external output signals ON and OFF.				
	Additional Item	OT# (<output number="">), OGH# (<output group="" number="">), OG# (<output group="" number="">) OGU# (<user group="" number="" output="">) Number of addressed output signals: OT#(xx)=1; OGH#(xx)=4 (per group); OG#(xx)=8 (per group); OGU#(xx)=32 max. (per group) OGH#(xx) is not subject to parity check; only the binary</user></output></output></output>				
	Example	specification is allowed. DOUT OT#(12) ON				
PULSE	Function	Outputs a pulse signal as an external output signal.				
	Additional Item	OT# (<output number="">), OGH# (<output group="" number="">), OG# (<output group="" number="">) OGU# (<user group="" number="" output="">) Number of addressed output signals: OT#(xx)=1; OGH#(xx)=4 (per group); OGU#(xx)=8 (per group); OGU#(xx)=32 max. (per group)</user></output></output></output>				
		T= <time (seconds)=""></time>	0.01 to 655.35 s 0.30 s unless otherwise specified			
	Example	PULSE OT# (10) T=0.60				
DIN	Function	Sets input signals in variables.				
	Additional Item	B <variable number=""> IN# (<input number=""/>), IGH# (<input group="" number=""/>), IG# (<input group="" number=""/>), IGU# (<user group="" input="" number="">),</user></variable>				
		OT# (<output number="">), OGH# (<output group="" number="">), OG# (<output group="" number="">), OGU# (<user group="" number="" output="">), SIN# (<system input="" number="">), SOUT# (<system number="" output="">) Number of addressed input signals: IN#(xx)=1; IGH#(xx)=4 (per group); IG#(xx)=8 (per group); IGU#(xx)=32 max. (per group) Number of addressed output signals: OT#(xx)=1; OGH#(xx)=4 (per group); OG#(xx)=8 (per group); OGU#(xx)=32 max. (per group); OGU#(xx)=32 max. (per group) IGH#(xx) and OGH#(xx) are not subject to parity check; only the binary specification is allowed.</system></system></user></output></output></output>				

9 Table of Basic Instructions

9.2 I/O Instructions

WAIT	Function	Waits until the external input signal status matches the specified status.			
	Additional Item	IN# (<input number=""/>), IGH# (<input group="" number=""/>), IG# (<input group="" number=""/>), IGU# (<user group="" input="" number="">), OT# (<output number="">), OGH# (<output group="" number="">), OG# (<output group="" number="">), OGU# (<user group="" number="" output="">), OGU# (<user group="" number="" output="">), SIN# (<system input="" number="">), SOUT# (<system number="" output="">), SOUT# (<system number="" output="">) B<variable number=""> Number of addressed input signals: IN#(xx)=1; IGH#(xx)=4 (per group); IGU#(xx)=32 max. (per group)</variable></system></system></system></user></user></output></output></output></user>			
		Number of addressed output signals: OT#(xx)=1; OGH#(xx)=4 (per group); OG#(xx)=8 (per group); OGU#(xx)=32 max. (per group)			
		T= <time (seconds)=""></time>	0.01 to 655.35 s		
	Example	WAIT IN# (12)=ON T=10.00 WAIT IN# (12)=B002			
AOUT	Function	Outputs the specified voltage to the general-purpose analog output port.			
	Additional Item	AO# (<output number="" port="">)</output>	1 to 40		
		<output voltage(v)=""></output>	-14.0 to 14.0 V		
	Example	AOUT AO# (2) 12.7	I		
ARATION	Function	Starts the analog output corresponding to the speed.			
	Additional	AO#(<output number="" port="">)</output>	1 to 40		
	Item	BV = <basic voltage=""></basic>	-14.00 to 14.00 V		
		V = <basic speed=""></basic>	0.1 to 1500.0 mm/s 1 to 9000 cm/min		
		OFV = <offset voltage=""></offset>	-14.00 to 14.00 V		
	Example	ARATION AO#(1) BV=10.00 V=200.0 OFV=2.00			
ARATIOF	Function	Ends the analog output corresponding to the speed.			
	Additional Item	AO#(<output number="" port="">)</output>	1 to 40		
	Example	ARATIOF AO#(1)	I		

- 9 Table of Basic Instructions
- 9.3 Control Instructions

JUMP	Function Jumps to the specified label or job.				
	Additional Item	* <label character="" string="">, JOB:<job name="">, LABEL:<label elements="">, IG# (<input group="" number=""/>), B<variable number="">, I<variable number="">, D<variable number="">, S<variable number=""></variable></variable></variable></variable></label></job></label>			
		UF# (user coordinates number)			
		IF statement			
	Example	JUMP JOB:TEST1 IF IN#(14)=OFF			
*	Function	Indicates a jump destination.			
(label)	Additional Item	<pre><jump destination=""> 8 charact less</jump></pre>			
	Example	*123			
CALL	Function	Calls the specified job.			
	Additional Item	JOB: <job name="">, IG# (<input group="" number=""/>), B<variable number="">, I<variable number="">, D<variable number="">, S<variable number=""></variable></variable></variable></variable></job>			
		ARGF <argument 1=""></argument>			
		ARGF <argument 2=""></argument>			
		ARGF <argument 3=""></argument>			
		ARGF <argument 4=""></argument>			
		ARGF <argument 5=""></argument>			
		ARGF <argument 6=""></argument>			
		ARGF <argument 7=""></argument>			
		ARGF <argument 8=""></argument>			
		UF# (user coordinates number)			
		IF statement			
	Example	CALL JOB:TEST1 IF IN# (24)=ON CALL IG#(2) (The job is called by the patterns of input signal. In this example, Job 0 cannot be called.)			
RET	Function	Returns to the call source job.			
	Additional Item	B <variable number="">, I<variable number="">, D<variable number="">, R<variable number="">, S<variable number="">, Constant, String</variable></variable></variable></variable></variable>			
		IF statement			
	Example	RET IF IN#(12)=OFF			
END	Function	Declares the end of a job.			
	Additional Item				
	Example	END	I		

9.3 Control Instructions

9 Table of Basic Instructions

9.3 Control Instructions

NOP	Function	No operation.				
	Additional Item					
	Example	NOP				
TIMER	Function	Stops for the specified time.				
	Additional Item	T= <time (seconds)=""></time>	0.01 to 655.35 s			
	Example	TIMER T=12.50				
IF statement	Function	Evaluates the specified condition and makes a judgment accordingly. Described after an instruction that specifies a certain action. Format: <item1>=,<>,<=,>=,<,><item2></item2></item1>				
	Additional	<item1></item1>				
	ltem	<item2></item2>				
	Example	JUMP *12 IF IN#(12)=OFF				
UNTIL statement	Function	Monitors the specified input signal during an action an when the specified signal status is observed. Describe that specifies a certain action.				
	Additional	IN# (<input number=""/>)				
	ltem	<status></status>				
	Example	MOVL V=300 UNTIL IN#(10)=ON	1			
PAUSE	Function	Instructs a pause.				
	Additional Item	IF statement				
	Example	PAUSE IF IN#(12)=OFF				
3	Function	Displays a comment.				
(comment)	Additional Item	<comment></comment>	32 characters or less			
	Example	'Draws 100mm size square.				
CWAIT	Function	Waits for execution of the instruction on the next line. Used with the NWAIT tag which is an additional item of a move instruction.				
	Additional Item					
	Example	MOVL V=100 NWAIT DOUT OT#(1) ON CWAIT DOUT OT#(1) OFF MOVL V=100				
ADVINIT	Function	Initializes the pre-reading instruction processing. Used to adjust the access timing for variable data.				
	Additional Item					
	Example	ADVINIT				
ADVSTOP	Function	Stops the pre-reading instruction processing. Used to adjust the access timing for variable data.				
	Additional Item					
	Example	ADVINIT				

- 9 Table of Basic Instructions
- 9.4 Shift Instructions

9.4 Shift Instructions

SFTON	Function	Starts a shift operation.			
	Additional Item	P <variable number="">, BP<variable number="">, EX<variable number="">, BF,RF,TF, UF#(<user coordinate="" number="">)</user></variable></variable></variable>		BF: base coordinates RF: robot coordi- nates TF: tool coordinates UF: user coordinates	
	Example	SFTON P001 UF#(1)			
SFTOF	Function	Stops a shift	a shift operation.		
	Additional Item				
	Example	SFTOF	SFTOF		
MSHIFT	Function	Obtains the shift value in the specified coordinate system from Data 2 and 3, and stores the obtained element values in Data 1. Format: MSHIFT <data1><coordinate><data2><data3></data3></data2></coordinate></data1>			
	Additional Item	Data1	PX <variable number=""></variable>		
		Coordinate	BF,RF,TF, UF# (<user coordinate="" number="">), MTF</user>	BF: base coordinates RF: robot coordi- nates TF: tool coordinates UF: user coordinates MTF: tool coordinates for the master	
		Data2	PX <variable number=""></variable>		
		Data3	PX <variable number=""></variable>		
	Example	MSHIFT PX0	PX000 RF PX001 PX002		

- 9 Table of Basic Instructions Operating Instructions
- 9.5

ADD	Function	Adds Data1 and Data2, and stores the result in Data1. Format:ADD <data1><data2></data2></data1>				
	Additional Item	Data1	B <variable number="">, I<variable number="">, D<variable number="">, R<variable number="">, P<variable number="">, BP<variable number="">, EX<variable number=""></variable></variable></variable></variable></variable></variable></variable>	Data1 must always be a variable.		
		Data2	Constant, B <variable number="">, I<variable number="">, D<variable number="">, R<variable number="">, P<variable number="">, BP<variable number="">, EX<variable number=""></variable></variable></variable></variable></variable></variable></variable>			
_	Example	ADD 1012 1013				
SUB	Function	Subtracts Data2 from Data1, and stores the result in Data1. Format:SUB <data1><data2></data2></data1>				
	Additional Item	Data1	B <variable number="">, I<variable number="">, D<variable number="">, R<variable number="">, P<variable number="">, BP<variable number="">,</variable></variable></variable></variable></variable></variable>	Data1 must always be a variable.		
			EX <variable number=""></variable>			
		Data2	EX <variable number=""> Constant, B<variable number="">, I<variable number="">, D<variable number="">, R<variable number="">, P<variable number="">, BP<variable number="">, EX<variable number=""></variable></variable></variable></variable></variable></variable></variable></variable>			

9.5 **Operating Instructions**

9 9.5 Table of Basic Instructions

MUL	Function	Multiplies Data1 by Data2, and stores the result in Data1. Format:MUL <data1><data2> Data1 can be an element in a position variable. If omitted, all elements are specified. Pxxx(1): 1st axis data, Pxxx(2): 2nd axis data, Pxxx(3): 3rd axis data, Pxxx(4): 4th axis data, Pxxx(5): 5th axis data, Pxxx(6): 6th axis data, Pxxx(7): 7th axis data, Pxxx(8): 8th axis data</data2></data1>				
	Additional Item	Data1	B <variable number="">, I<variable number="">, D<variable number="">, R<variable number="">, P<variable number="">, (<element number="">), BP<variable number=""> (<element number="">), EX<variable number="">),</variable></element></variable></element></variable></variable></variable></variable></variable>	Data1 must always be a variable.		
		Data2	Constant, B <variable number="">, I<variable number="">, D<variable number="">, R<variable number=""></variable></variable></variable></variable>			
	Example	MUL I012 I013 MUL P000 (3) 2 (Multiply the Z-axis data by 2.)				
DIV	Function	Divides Data1 by Data2, and stores the result in Data1. Format:DIV <data1><data2> Data1 can be an element in a position variable. If omitted, all elements are specified. Pxxx(1): 1st axis data, Pxxx(2): 2nd axis data, Pxxx(3): 3rd axis data, Pxxx(4): 4th axis data, Pxxx(5): 5th axis data, Pxxx(6): 6th axis data, Pxxx(7): 7th axis data, Pxxx(8): 8th axis data</data2></data1>				
	Additional Item	Data1	B <variable number="">, I<variable number="">, D<variable number="">, R<variable number="">, P<variable number="">, (<element number="">), BP<variable number=""> (<element number="">), EX<variable number=""> (<element number="">)</element></variable></element></variable></element></variable></variable></variable></variable></variable>	Data1 must always be a variable.		
		Data2	Constant, B <variable number="">, I<variable number="">, D<variable number="">, R<variable number=""></variable></variable></variable></variable>			
	Example	DIV 1012 10 DIV P000 (3	3) 2 (Divide the Z-axis data by 2.)			
INC	Function		the value of the specified variable by 1.			
	Additional Item	B <variable i<br="">I<variable n<br="">D<variable< td=""><td>umber>,</td><td></td></variable<></variable></variable>	umber>,			

9 Table of Basic Instructions

DEC	Function	Decrements	the value of the specified variable by 1.			
	Additional	B <variable number="">, I<variable number="">, D<variable number=""></variable></variable></variable>				
	Item					
	Example	DEC 1043				
AND	Function		Obtains the AND of Data1 and Data2, and stores the result in Data1 Format:AND <data1><data2></data2></data1>			
	Additional	Data1	B <variable number=""></variable>			
	Item	Data2	B <variable number="">, Constant</variable>			
	Example	AND B012 I	3020			
OR	Function		OR of Data1 and Data2, and stores the r <data1><data2></data2></data1>	esult in Data1.		
	Additional	Data1	B <variable number=""></variable>			
	Item	Data2	B <variable number="">, Constant</variable>			
	Example	OR B012 B	020			
NOT	Function		NOT of Data2, and stores the result in D [<data1><data2></data2></data1>	ata1.		
	Additional	Data1	B <variable number=""></variable>			
	ltem	Data2	B <variable number="">, Constant</variable>			
	Example	NOT B012 I	3020			
XOR	Function	Obtains the exclusive OR of Data1 and Data2, and stores the result in Data1. Format:XOR <data1><data2></data2></data1>				
	Additional	Data1	B <variable number=""></variable>			
	Item	Data2	B <variable number="">, Constant</variable>			
	Example	XOR B012	8020			
SET	Function	Sets Data2 to Data1. Format:SET <data1><data2></data2></data1>				
	Additional Item	Data1	B <variable number="">, I<variable number="">, D<variable number="">, R<variable number="">, P<variable number="">, S<variable number="">, BP<variable number="">, EX<variable number=""></variable></variable></variable></variable></variable></variable></variable></variable>	Data1 must always be a variable.		
		Data2	Constant, B <variable number="">, I<variable number="">, D<variable number="">,</variable></variable></variable>			
	Example	SET 1012 10	R <variable number="">, EXPRESS</variable>			

9 Table of Basic Instructions

SETE	Function	Sets data to an element in a position variable. Pxxx(1): 1st axis data, Pxxx(2): 2nd axis data, Pxxx(3): 3rd axis data, Pxxx(4): 4th axis data, Pxxx(5): 5th axis data, Pxxx(6): 6th axis data, Pxxx(7): 7th axis data, Pxxx(8): 8th axis data			
	Additional Item	Data 1	P <variable number=""> (<element number="">), BP<variable number=""> (<element number="">), EX<variable number=""> (<element number="">)</element></variable></element></variable></element></variable>		
		Data 2	D <variable number="">, double-precision integer type constant</variable>		
	Example	SETE P012	2 (3) D005		
GETE	Function	Extracts an element in a position variable. Pxxx(1): 1st axis data, Pxxx(2): 2nd axis data, Pxxx(3): 3rd axis data, Pxxx(4): 4th axis data, Pxxx(5): 5th axis data, Pxxx(6): 6th axis data, Pxxx(7): 7th axis data, Pxxx(8): 8th axis data			
	Additional Item	D <variable number=""> P<variable number=""> (<element number="">), BP<variable number=""> (<element number="">), EX<variable number=""> (<element number="">)</element></variable></element></variable></element></variable></variable>			
	Example	GETE D00	6 P012 (4)		
GETS	Function	Sets a system variable to the specified variable.			
	Additional Item	B <variable I<variable r<br="">D<variable R<variable PX<variabl S<variable< td=""><td>number>, number>, number>, e number>,</td><td></td></variable<></variabl </variable </variable </variable></variable 	number>, number>, number>, e number>,		
		\$I <variable \$D<variabl \$R<variabl< td=""><td>e number>, e number>, e number>, e number>, ble number>,</td><td>System variable</td></variabl<></variabl </variable 	e number>, e number>, e number>, e number>, ble number>,	System variable	
	Example	GETS B00 GETS I001 GETS PX0			

CNVRT	Function		variable of the I variable in Data1.	
	Additional	Data1	PX <variable number=""></variable>	
	Item	Data2	PX <variable number=""></variable>	
			F# (<user coordinate="" number="">), MTF</user>	BF: base coordinates RF: robot coordinates TF: tool coordinates UF: user coordinates MTF: tool coordinates for the master
		TL#(<tool nur<="" th=""><th>nber>)</th><th></th></tool>	nber>)	
	Example	CNVRT PX00	0 PX001 BF	
CLEAR	Function	variables as s	the variable number in Data1, clears (set specified by a number in Data2. R <data1><data2></data2></data1>	ts to zero) as many
	Additional Item	Data1	B <variable number="">, I<variable number="">, D<variable number="">, R<variable number="">, \$B<variable number="">, \$I<variable number="">, \$D<variable number="">, \$R<variable number="">,</variable></variable></variable></variable></variable></variable></variable></variable>	
		Data2	<number of="" variables="">, ALL,STACK</number>	ALL: Clears variables of the variable number in Data1 and of all the variable numbers that follow. STACK: Clears all variables in the job call stack.
	Example	CLEAR B000 CLEAR STAC		
SIN	Function	Obtains the sine of Data2 (unit: deg.), and stores the result in Data1. Format: SIN <data1><data2></data2></data1>		
	Additional Item	Data1	R <variable number=""></variable>	Data1 must always be a real type variable.
		Data2	<constant>, R<variable number=""></variable></constant>	
	Example	SIN R000 R0	01 (Sets the sine of R001 to R000.)	· ·
COS	Function		osine of Data2 (unit: deg.), and stores th <data1><data2></data2></data1>	e result in Data1.
	Additional Item	Data1	R <variable number=""></variable>	Data1 must always be a real type variable.
		Data2	<constant>, R<variable number=""></variable></constant>	
	Example	COS R000 R	001 (Sets the cosine of R001 to R000.)	

9 9.5 Table of Basic Instructions

ATAN	Function		e arc tangent of Data2 (unit: deg.), and AN <data1><data2></data2></data1>	stores the result in Data
	Additional Item	Data1	R <variable number=""></variable>	Data1 must always be a real type variable.
		Data2	<constant>, R<variable number=""></variable></constant>	
	Example	ATAN R000	R001 (Sets the arc tangent of R001 to	o R000.)
SQRT	Function		square root of Data2, and stores the RT <data1><data2></data2></data1>	result in Data1.
	Additional Item	Data1	R <variable number=""></variable>	Data1 must always be a real type variable.
		Data2	<constant>, R<variable number=""></variable></constant>	
	Example	SQRT R00	0 R001 (Sets the square root of R001	to R000.)
MFRAME	Function	as definition data, <data definition pe Format: MF This also cr Directly spe</data 	er coordinates using the position data in points. <data1> indicates the definit a2> the definition point XX position data point XY position data. FRAME <user coordinates=""> <data1> < reates user coordinates from the positi ecifies the user coordinates position in FRAME <user coordinates=""> <data 4=""> t n</data></user></data1></user></data1>	ion point ORG position a, and <data3> the Data2> <data3> on data of a given point. <data 4="">.</data></data3></data3>
	Additional Item	UF#(<user P<variable< td=""><td>coordinate number>) number></td><td>User coordinate number: 1 to 63</td></variable<></user 	coordinate number>) number>	User coordinate number: 1 to 63
		Data1	PX <variable number=""></variable>	
		Data2	PX <variable number=""></variable>	
		Data3	PX <variable number=""></variable>	
		Data4	PX <variable number=""></variable>	
		BF, UF#(<u< td=""><td>ser coordinate number>)</td><td>BF: base coordinates UF: user coordinates</td></u<>	ser coordinate number>)	BF: base coordinates UF: user coordinates
	Example	MFRAME UF#(1) PX000 PX001 PX002 MFRAME UF#(1) P000 BF		·
MULMAT	Function	Obtains the matrix product of Data2 and Data3, and stores the resu Data1. Format: MULMAT <data1> <data2> <data3></data3></data2></data1>		
	Additional	Data1	P <variable number=""></variable>	
	Item	Data2	P <variable number=""></variable>	
		Data3	P <variable number=""></variable>	
	Example	MULMAT P	000 P001 P002	
INVMAT	Function		inverse matrix of Data2, and stores th /MAT <data1> <data2></data2></data1>	e result in Data1.
	Additional	Data1	P <variable number=""></variable>	
	Item	Dete2	P <variable number=""></variable>	
		Data2		

9 Table of Basic Instructions

SETFILE	Function	•	contents data of a condition file into the nur data of a condition file to be changed is sp per.			
	Additional Item	Contents data of a condition file	WEV#(<condition file<br="">number>)(<element number="">)</element></condition>			
		Data1	Constant, D <variable number=""></variable>			
	Example	SETFILE WEY	V#(1)(1) D000			
GETFILE	Function		Stores the contents data of a condition file in Data1. The contents data of a condition file to be obtained is specified by the element number.			
	Additional	Data1	D <variable number=""></variable>			
	ltem	Contents data of a condition file	WEV#(<condition file<br="">number>)(<element number="">)</element></condition>			
	Example	GETFILE DOD	00 WEV#(1)(1)			
GETPOS	Function	Stores the pos	sition data of Data2 (step number) in Data	1.		
	Additional	Data1	PX <variable number=""></variable>			
	Item	Data2	STEP# (<step number="">)</step>			
	Example	GETPOS PX0	000 STEP#(1)			
VAL	Function	Converts the numeric value of the character string (ASCII) of Data2 into the real number, and stores the result in Data1. Format: VAL <data1> <data2> cardinal number</data2></data1>				
	Additional Item	Data1	B <variable number="">, I <variable number="">, D <variable number="">, R <variable number=""></variable></variable></variable></variable>			
		Data2	Character string, S <variable number=""></variable>			
		RADIX= <card< td=""><td>inal number></td><td></td></card<>	inal number>			
	Example	VAL B000 "12	3"	•		
ASC	Function	Obtains the character code of the first letter of the character string (ASCII) Data2, and stores the result in Data1. Format: ASC <data1><data2></data2></data1>				
	Additional	Data1	B <variable number=""></variable>			
	Item	Data2	Character string,			
			S <variable number=""></variable>			
	Example	ASC B000 "AI				
CHR\$	Example Function	Obtains the ch the result in D	BC" haracter (ASCII) with the character code o	f Data2, and stores		
CHR\$		Obtains the ch the result in D	BC" haracter (ASCII) with the character code o ata1.	f Data2, and stores		
CHR\$	Function	Obtains the ch the result in D Format: CHRS	BC" haracter (ASCII) with the character code o ata1. \$ <data1><data2></data2></data1>	f Data2, and stores		

9 9.5 Table of Basic Instructions

MID\$	Function	character s	Obtains the character string (ASCII) of any length (Data 3, 4) from the character string (ASCII) of Data2, and stores the result in Data1. Format: MID\$ <data1><data2><data3><data4></data4></data3></data2></data1>		
	Additional	Data1	S <variable number=""></variable>		
	ltem	Data2	Character string, S <variable number=""></variable>		
		Data3	Constant, B <variable number="">, I <variable number="">, D <variable number=""></variable></variable></variable>		
		Data4	Constant, B <variable number="">, I <variable number="">, D <variable number=""></variable></variable></variable>		
	Example	MID\$ S000 "123ABC456" 4 3			
LEN	Function	Obtains the total number of bytes of the character string (ASCII) of Data2, and stores the result in Data1. Format: LEN <data1><data2></data2></data1>			
	Additional Item	Data1	B <variable number="">, I <variable number="">, D <variable number=""></variable></variable></variable>		
		Data2	Character string, S <variable number=""></variable>		
	Example	LEN B000 "ABCDEF"			
CAT\$	Function	Combines the character string (ASCII) of Data2 and Data3, and stores result in Data1. Format: CAT\$ <data1><data2><data3></data3></data2></data1>			
	Additional	Data1	S <variable number=""></variable>		
	ltem	Data2	Character string, S <variable number=""></variable>		
		Data3	Character string, S <variable number=""></variable>		
	Example	CAT\$ S000) "ABC" "DEF"
